(57) Abstract :  
ABSTRACT A SOLAR-POWERED EVAPORATION DEVICE The present invention discloses a device (100) for solar-powered refrigerant evaporation. The device (100) comprises an absorber plate (104) , a plurality of pin fins (108-1, 108-2, 108-3, , 108-n) and a refrigerant circulation assembly (300). The absorber plate (104) is configured to absorb solar radiation. The plurality of pin fins (108-1, 108-2, 108-3, , 108-n) is a hollow cylindrical structure mounted on the absorber plate (104) and filled with a phase change material. The plurality of pin fins (108-1, 108-2, 108-3, , 108-n) is configured to store latent thermal energy. The refrigerant circulation assembly (300) is positioned beneath the absorber plate (104). The refrigerant circulation assembly (300) comprises a plurality of copper tubes (302-1, 302-2, 302-3, , 302-n) arranged in a parallel configuration between a pair of header tubes (304-1, 304-2), and wherein the refrigerant circulation assembly (300) is configured to maintain refrigerant flow by thermosyphon action.

(57) Abstract :

ABSTRACT A FREEZING SYSTEM FOR SHOCK FREEZING OF FLUID The present disclosure provides a freezing system (100) for shock freezing of fluid. The freezing system (100) includes a freezing compartment (102) configured to freeze at least one fluid storage means (104). In addition, the freezing compartment (102) includes the plurality of slabs (106). Further, two slabs form the plurality of slabs (106) define a set (108a, 138a, 138b, 140a, 140b). Furthermore, one slab (110) configured to move in an angular direction and a linear direction. Moreover, another slab (112) configured to move in the angular direction. Also, the plurality of slabs (106) are in contact with the at least one fluid storage means (104). Further, the one slab (110) and the another slab (112) clamp and compress the at least one fluid storage means (104) between them. The set (108a, 138a, 138b, 140a, 140b) is configured to perform a back & fourth tilting motion around a fixed axis (136). (to be published with FIG. 2)

(57) Abstract :  
System for early detection of cerebral palsy is described herein. The system comprises computing device and a plurality of sensors. The computing device with a processor and a memory operably coupled to the processor. The plurality of sensor (10, 20) configured for placement at the infant's upper limb. The plurality of sensor (30, 40) configured for placement at the infant's lower limb. The sensor (50) configured for placement at the infant's trunk portion. The computing device receives tri-axial data of the joint angles from the plurality of sensor (10, 20, 30, 40, 50). The processor analyzes the motion data to detect a kinematic feature.

(57) Abstract :

**ABSTRACT METHOD FOR MONITORING THE SYNTHESIS QUALITY OF A METAL-ORGANIC FRAMEWORK (MOF) VIA EVAPORATIVE DRYING PATTERN** The present disclosure provides a method for monitoring the synthesis quality of a metal-organic framework (MOF) via evaporative drying pattern. The method comprises the step providing a metal-organic framework solution comprising at least one of non-purified pore-inactivated metal-organic framework (MOF) and purified pore-activated metal-organic framework (MOF) colloidal particles, followed by dispersing at least one reaction precursor of a concentration with the metal-organic framework (MOF) solution of a concentration in water thereby forming a sample for monitoring the purity. Followed by depositing at least one drop of the sample onto a substrate and drying the at least one droplet on the substrate at the room temperature with a humidity in the range of 40 to 50% thereby forming at least one drying pattern on the substrate and analyzing the characteristics of the drying pattern of the droplet on the substrate for identifying the quality of the MOF from the analysis. (57) Abstract :  
An IoT and AI-based coal mine risk prediction system (100) and method (200) thereof is disclosed. The system (100) includes one or more sensors, and a microcontroller (102). The one or more sensors is configured to continuously collect environmental data from a coal mine. The microcontroller (102) is configured with a machine learning module and an AI module. The microcontroller (102) is configured to process and analyse the collect environmental data for patterns to predict potential accidents in the coal mine. The microcontroller (102) is configured to categorize the analysed patterns into risk levels. Further, the risk levels comprises a low, a medium, or a high/critical level based on predefined thresholds. The microcontroller (102) is configured to continuously monitor the coal mine in a loop for ensuring continuous safety assessment. FIG. 1

(57) Abstract :  
Disclosed data processing apparatus (106) includes processing circuitry (120), selects one or more first social media posts using one or more prompts, and selects textual content, layout, non-textual content, style, and language from first plurality of textual contents, second plurality of layouts, third plurality of non-textual contents, fourth plurality of styles, and fifth plurality of languages respectively, extracted from the one or more first social media posts. Furthermore, the processing circuitry (120), generates a second social media post by consolidating the textual content, the layout, the non-textual content, the style and the language within a selected template. Furthermore, the processing circuitry (120), either allows or refines the second social media post, and posts the second social media post automatically on one or more social media platforms on a generated schedule and use information of one or more post insights for future content generation. FIG. 2 is the reference figure.

(54) Title of the invention : AI Based nanomaterial Synthesizing Machine

(57) Abstract :

ABSTRACT AI Based nanomaterial Synthesizing Machine The present invention relates to an intelligent and automated system for synthesizing nanomaterials using advanced artificial intelligence algorithms. The AI-Based Nanomaterial Synthesizing Machine is designed to enhance the precision, efficiency, and adaptability of nanomaterial production processes. Traditional synthesis methods often suffer from inconsistencies, lack of control, and manual intervention, which limit scalability and reproducibility. This invention addresses these challenges by integrating AI-driven decision-making with real-time sensor feedback to dynamically control synthesis parameters. The system includes multiple functional modules, such as a chemical reagent dispensing unit, a synthesis reactor with environmental control, a sensor array for real-time monitoring, and an AI controller for adaptive process management. The AI module uses deep learning and reinforcement learning techniques to predict and adjust the optimal synthesis route based on the desired output properties. Throughout the reaction, data from the sensors are continuously fed back into the AI system, which then fine-tunes parameters like temperature, concentration, and reaction time to maintain optimal conditions. By combining artificial intelligence with automated nanomaterial synthesis, the proposed machine offers several advantages, including higher purity, better reproducibility, and reduced human error. It enables the customizable production of various nanomaterials such as nanoparticles, nanorods, and nanotubes for diverse applications in medicine, electronics, and environmental science. This innovation marks a significant advancement in nanotechnology, paving the way for scalable and intelligent manufacturing of next-generation materials.

(57) Abstract :

Abstract This invention provides a machine learning-based price prediction model specifically tailored for 22 essential agri-horticultural commodities. Leveraging Long Short-Term Memory (LSTM) neural networks, the system integrates historical pricing data with environmental variables such as temperature, rainfall, and humidity to forecast commodity prices across multiple timeframes—daily, weekly, monthly, and yearly. The model is capable of comparing price trends across 550 regional centers, offering critical insights for farmers, policymakers, and supply chain stakeholders. Implemented using Python, TensorFlow, and Keras, the system automates data ingestion, preprocessing, training, and visualization on a cloud infrastructure, ensuring scalability and real-time updates. The invention improves upon traditional statistical forecasting methods by accurately capturing long-term temporal dependencies and environmental influences. It empowers data-driven decision-making, enhances food supply chain planning, and provides a flexible tool for agricultural price monitoring and intervention.

(57) Abstract :

ABSTRACT DRAINAGE PIPE ASSEMBLIES FOR ALL TYPES OF AIR-CONTIONS AND REFRIGERATION The present invention relates to the pipe Assembly between Air-condition drainage outlet pipe and drainage pipe. The present invented Assemblies are tool free, ready to use. A technician no need to cutting and pasting different pipes to make assembly at site as before. The present invented assemblies are designed in various types and in various sizes according to types of air-condition and site condition where the air-condition unit was installed, as given in detailed description. The Assemblies are so designed that by using these assemblies when drainage pipe get chocked , a technician can easily remove this assembly without cutting the pipes between Air-condition drainage outlet point and drainage pipe, clean the chockage and again reassemble the assembly between Air-condition drainage outlet point and drainage pipe. It gives satisfaction to both technician and consumer by saving time and money.

(57) Abstract :

ABSTRACT [505] The BIOSENTINAL carcinogen detection system presents an innovative biosensing framework for rapid pesticide residue identification that integrates advanced enzymatic recognition with electrochemical transduction mechanisms, facilitating comprehensive contaminant characterization, accurate concentration measurement, and real-time safety assessment while maintaining analytical reliability and operational simplicity for enhanced consumer protection during food safety evaluation. [510] The multifaceted biosensing architecture employs specialized biorecognition methodologies and adaptive signal processing algorithms, utilizing miniaturized electrochemical components and energy-efficient optical sensors to ensure robust pesticide detection, enhanced analytical sensitivity, and optimized performance reliability while maintaining statistically significant concordance with laboratory reference methods across diverse agricultural produce categories. [515] The integrated detection methodology combines saline-based extraction techniques with multiplexed biosensing platforms, leveraging specific enzyme-substrate interaction patterns and multi-modal signal indicators to optimize screening procedures and verification workflows for maximum detection accuracy and minimal false-negative exposure during critical consumer decision-making processes. [520] The novel responsive sensing architecture features engineered immunoassay components with specialized signal amplification protocols, enabling complex multi-analyte contaminant verification while ensuring measurement consistency and performance optimization across various fruit and vegetable matrices without compromising detection reliability. [525] The innovative analytical design incorporates strategic calibration mechanisms for enhanced pesticide detection and measurement accuracy, utilizing optimized biorecognition elements and adaptive transduction technology to ensure legitimate contaminant identification while maintaining functionality across diverse environmental conditions and varied sample preparation scenarios. [530] Implementation methodology emphasizes scalable integration and efficient detection sequences, implementing interactive user interfaces and threshold-based alarm algorithms to achieve superior identification accuracy, enhanced quantitative precision, and false-positive minimization while ensuring technological simplicity during field application. [535] The system demonstrates exceptional adaptability through comprehensive integration of electrochemical signature detection and intelligent optical recognition technologies, validating its effectiveness across various produce types and contamination scenarios while maintaining consistent analytical performance and operational efficiency under diverse testing conditions. [540] The developed framework enables sustainable and reliable identification of carcinogenic pesticide residues through streamlined, biosensor-powered analytical systems, providing significant advantages over traditional laboratory approaches through portable detection capabilities, adaptive sensing protocols, and improved accessibility while maintaining superior analytical accuracy during critical food safety assessment stages.

## (57) Abstract :

Advantages of the Invention: • Up to 20–30% increased power output in low-wind-speed conditions. • Reduced blade fatigue due to aerodynamic load balancing. • Lower maintenance due to the passive adaptation system. • Improved noise performance, making it suitable for urban and residential installations. • Environmentally sustainable materials and design methodology. \_\_\_\_\_ Industrial Application: This invention is suitable for onshore and offshore wind turbines, particularly in regions with inconsistent wind patterns. The blade design can be scaled for small-scale decentralized turbines or large utility-scale farms. \_\_\_\_\_ Conclusion: The invention presents a breakthrough in aerodynamic blade design, offering higher energy efficiency, adaptability, and durability, thereby promoting widespread adoption of sustainable wind energy technologies.

(57) Abstract :

Provided herein is a Fe<sub>3</sub>O<sub>4</sub>/MWCNTs-COOH nanohybrid incorporated into Psf Hollow Fiber membrane for As<sup>3+</sup> and Cd<sup>2+</sup> ions separation from contaminated water. Also provided herein a method for fabricating the Fe<sub>3</sub>O<sub>4</sub>/MWCNTs-COOH nanohybrid incorporated Psf Hollow Fiber membrane. The membrane has the potential to remove toxic metals from aqueous solutions, making it a promising candidate for water treatment applications.

(57) Abstract :

“AN TRITERPENOID GLYCOSIDAL DERIVED ANTICANCER NANOPARTICLE FORMULATION AND METHOD OF PREPARATION THEREOF” The present invention relates to the field of nanoparticle formulation. Specifically, the invention relates to a triterpenoid glycoside-based nanoparticle formulation for the management of breast cancer and a method for preparing the same. The nanoparticle formulation comprises ursolic acid, 18β-glycyrrhetic acid, a nanoparticle forming agent, an oil, a surfactant, a co-surfactant and solvent.

(57) Abstract :

ABSTRACT The present invention provides a chitosan-copper nanoparticle complex for plant protection. The complex comprises chitosan nanoparticles having a size range of 100-700 nm, copper nanoparticles, and a cross-linking agent binding the chitosan nanoparticles and copper nanoparticles. The complex has a chitosan-to-copper ratio of 8:1 to 12:1 by weight. A method of preparing the complex includes dissolving chitosan in acetic acid, adding the copper salt, reducing the copper salt to form copper nanoparticles in-situ within the chitosan matrix, and cross-linking the chitosan and copper nanoparticles. The complex can be applied to plants or plant parts for protection against bacterial and fungal diseases.

(54) Title of the invention : MULTIMODAL LANGUAGE TRANSLATION AND COMMUNICATION WEARABLE GLASSES

Address of Applicant :Department of Information and Communication  
Technology, Marwadi University, Rajkot - Morbi Road, Rajkot 360003 Gujarat,  
India. Rajkot -----

A multimodal language translation and communication wearable glasses, comprising a transparent frame 101 developed to be worn by a user and adapted to rest on user's nose and ears, an array of directional microphones 106 configured to capture ambient sound from multiple directions, an AI-powered camera 110 integrated with facial recognition and gesture recognition capabilities, an augmented reality heads-up display (HUD) integrated into lens 103 of the frame 101, a translation module configured to provide real-time translation of spoken language, sign language, and gestures into a preferred language of user, at least two ear units 107 mounted on articulated arms connected to temple ends to enhance audio clarity and filter background noise, and a microcontroller configured to coordinate data processing from microphones 106, AI camera, sensors, translation module, and AR HUD, microcontroller facilitates real-time context-aware language translation and communication assistance for user interaction.

(57) Abstract :  
A workout support and safety device, comprising of a body 101 installed with an imaging unit 102, configured to navigate within an exercise facility, multiple Tri-Star wheels 103 for omnidirectional movement and positioning of the body 101 relative to user, a roller 104 carrying a band 105 for unrolling the band 105 to provide physical assistance, two rods 106 mounted on vertical sliders 107, include springs 108 to absorb weight and provide support by actuating beneath the user’s elbows during weightlifting, a plate 109 mounted via a ball and socket joint 110, to interpose between the user and the equipment to prevent injury, two bars 111 mounted via a spherical joint 112, each bar comprising a gripper 113, the bars 111 assists the user in lifting weights or securing exercise equipment safely, a pole 114 actuated via a pusher 115 pushes against a user’s legs during exercises to provide resistance.

## (57) Abstract :

An automated property inspection and maintenance device, comprising a body 101 configured with multiple omnidirectional wheels 102 each to navigate across surface of a property, an imaging unit 104 to map the property to plan an efficient path for inspection, a clamp 105 via a rod 106 retrieves replacement LEDs from a first chamber 107 for replacing defective ones, a plate 108 with embedded bristles 109 by means of a L-shaped bar 110 for scrubbing bristles 109 against surface, multiple suction units 111 captures dust and debris for storage in a compartment 112, a circular pad 113 with multiple pneumatic pins 114 installed on a L-shaped pole 115 for pins 114 to dislodge debris, a pair of robotic arms 119 to extract and insert an air conditioning filter into a container 120, a multi-sectioned chamber 122 to store liquid paints connected to a conduit 125 for spraying during touchups.

(57) Abstract :  
A food storage device, comprising an enclosure 101 having multiple slidable shelves 102, a chamber 105 having a RFID scanner 106 to determine type of food item, an articulated pusher 107 push food item onto shelf 102, a communication unit generates notification via a user-interface to inform regarding unsuitable food and food items about to expire, a Peltier unit 108 maintain temperature of shelf 102, a grid of plates 109 arranged over each shelves 102 for raising the food item having earliest expiry date for consumption, a roller 111 supported over each shelves 102 via an extendable frame 112 and unroll a member across the frame 112 to cover the shelf 102, multiple ethylene sensors in combination with an artificial intelligence (AI) based camera 115 to detect rotten food item, an articulated laser pointer 116 to point at the rotten food item for reference of the user.

(57) Abstract :  
A football sports performance assessment and career recommendation system, comprises of a rectangular evaluation field structure 101 to simulate a football testing environment, a pair of wearable units 102 including wearable shoes 102a and a wearable vest 102b to be worn by the student, a plurality of force sensors capture data regarding strike power and pressure during kicking, wearable vest 102b comprises heart rate sensors 105, respiration sensors 106, and skin conductance sensors 107 to assess stamina and stress response of the student during the session, a projection unit 108 on a horizontally movable sliding rail 109 to project one or more virtual target zones on the goalpost, an imaging unit 110 for capturing facial expressions of the student during the trial to derive psychological stress cues and integrates same into the student's performance evaluation, a display 111 or speaker 112 guides the student through each phase of the trial.

(57) Abstract :  
A two-wheeler speed regulation and safety system is comprising, a hollow cylindrical body 101 on the handlebar accelerator, gripped by first pneumatic plungers 101a and first C-shaped motorized clamps 101b, a motorized mechanical sleeve 101c controls speed and secured by a locking unit activated by a fingerprint module 101d for user authentication, a cylindrical structure 102 with second pneumatic plungers 102a and second motorized C-shaped clamps 102b mount on a left handle, a motorized clipper 102c linked to a bell crank linkage arrangement 102d presses the clutch lever, a gear shifting module 104 with curved clamps 104a and a slider crank arrangement 104b including a motorized clamp 104c, shifts gears, an AI-based imaging unit 103 captures surroundings for safe clutch engagement and acceleration control, safety indicators are displayed on a cylindrical-shaped LED screen 101e, a vibration unit 101f provides tactile alerts, an accelerometer and gyroscope sensor detect impacts.

(57) Abstract :  
A safety and communication integrated watercraft for marine operations, comprising a body 101 having a hull 102 and a deck 103, a pair of retractable hydrofoils 104 on either side of the hull 102 for altering shape in response wave-induced motion, a rack and pinion assembly 105 preloaded by a spring 106, and held by a mechanical latch 107 for preventing untended movement, a sensor suite 108 including an Inertial Measurement Unit (IMU), a pressure sensor, and wave height detectors, detecting storm condition signals, a plurality of inflatable life-pod units 109 detachably housed in a container 110, and connected to an inflating unit 111 for inflation/deflation, while the life-pod units 109 are assembled with multiple survival gears, a multi-modal communication module installed on the body 101 for facilitating direct contact with other watercrafts and concerned authorities, and dynamically switches modes in response to system failure or signal interference.

## (57) Abstract :

A metal piece quality assessment device is comprising, a housing 101 is installed with a plate 102 configured to receive a metal piece, a sensing module 103 on the plate 102 measures the metal piece's weight and dimensions, a gripping unit 104 on an extendable rod 105 submerges the piece into a water-filled chamber 106, a graduated cylinder 107 connected to a tray 108 collects displaced water through a conduit 109, an artificial intelligence-based imaging unit 110 determining the volume for density calculation, an expandable flap 111 with a linear actuator 112 and heating coil 113 applies compressive force and heat, a three-finger motorized gripper 114 conducts a scratch test, a pair of clamps 118 via extendable links 119 with motorized ball and socket joints 120 holding multi-meter probes for conductivity testing, an XRF spectroscopy module 122 measures the material composition of the metal piece.

(57) Abstract :

ABSTRACT A nanofluid composition and a heat pipe system for passive thermal management of high-wattage light-emitting diodes A heat pipe system comprises a copper tube (102) of approx. 8 mm OD and 7.6 mm ID partitioned into evaporator (112), adiabatic (114) and condenser (116) sections in a 1:1:1.5 ratio, with a stainless-steel screen-mesh wick structure (104) lining the inner wall. A nanofluid working medium (106) containing about 1.0 wt % copper oxide or silica nanoparticles in de-ionized water fills approximately 60% of the internal volume. In operation, heat from the LED package induces boiling in the evaporator (112), vapor travels through the adiabatic section (114) to the condenser (116) where latent heat is released to an external fin array (118), and condensate returns via capillary forces in the wick (104). A vacuum/filling port (108), end caps (109), thermal interface material (122) and mounting bracket (120) enable hermetic sealing and optimized thermal contact.

(57) Abstract :

A cylindrical heat pipe system incorporating an Al<sub>2</sub>O<sub>3</sub>-ZnO hybrid nanofluid working medium for passive thermal management The present invention relates to the field of passive thermal management and more particularly to a cylindrical heat pipe system (10) comprising a seamless oxygen-free copper tube (10) demarcated into an evaporator region (12), an adiabatic region (14) and a condenser region (16), a two-layer capillary wick structure (20) of concentric copper screen mesh sleeves engaging the inner surface of tube (10), a hybrid nanofluid working medium (40) of deionized water carrying aluminium oxide and zinc oxide nanoparticles at a total loading of 1 wt % occupying approximately 60 % of the volume of evaporator region (12), a flexible electric heater (50) wrapped around evaporator region (12), a water-circulating cooling chamber (60) thermally bonded to condenser region (16), and end-cap assemblies (30) maintaining an internal pressure below  $1 \times 10^{-3}$  mbar; wherein vapor generated by heater (50) in evaporator region (12) travels through adiabatic region (14) to condenser region (16) for phase change and condensate returns via capillary action through wick structure (20).

(57) Abstract :

A system for minimum quantity lubrication (MQL) incorporates a dual-nanoparticle cutting fluid composition and synthesis method that enhances turning operations. The system comprises a MQL delivery unit with a nozzle featuring a tapered orifice and a mixing chamber having first and second inlet channels receiving nano-cutting fluid from a pressurizable fluid reservoir equipped with an integrated pressure control valve and compressed air, respectively. The dual-nanoparticle cutting fluid, based on SAE-40 oil and containing predetermined weight percentages of Aluminum oxide (Al<sub>2</sub>O<sub>3</sub>) and Zinc oxide (ZnO), is synthesized via magnetic stirring followed by ultrasonic homogenization to ensure uniform dispersion. The resulting aerosol mist is delivered to the tool-workpiece interface, optimizing machining parameters during turning operations.

(57) Abstract :  
ABSTRACT A SYSTEM AND METHOD FOR INTEGRATED PASSIVE THERMAL MANAGEMENT OF LITHIUM-ION BATTERY PACKS USING A DI WATER-FILLED CYLINDRICAL HEAT PIPE A passive thermal management system is disclosed for lithium-ion battery packs, comprising a battery pack assembly having a plurality of lithium-ion cells arranged in series-parallel configuration within a housing with predefined channels and an integrated cylindrical heat pipe. The heat pipe, fabricated from copper with an 8 mm outer diameter and 7.6 mm inner diameter, is segmented into an evaporator section in thermal contact with the cells, an adiabatic section for vapor transport, and a condenser section positioned toward a heat dissipation region. DI water, filled at a 30% volumetric ratio, undergoes phase change, while a single-layer stainless steel screen mesh wick promotes capillary return of condensate. Temperature sensors may be positioned near the cells to monitor operational heat, ensuring effective cyclic management of thermal energy.

(57) Abstract :

Real-Time Destination-Aware Public Transport Guidance System with Cloud-Based Route Filtering This invention describes an intelligent, destination-aware, real-time public transport guidance system comprising vehicle-mounted route input devices, a cloud-based backend with directional filtering algorithms, and a mobile application for passenger interaction. Authorized personnel manually input journey start and end points into the embedded device, which, along with real-time GPS data, is transmitted to a centralized cloud server. Passengers use the mobile app to input their destination, triggering the backend to execute geospatial and vector-based route matching. The system filters and identifies only those vehicles proximate to the user and traveling toward the specified destination. Real-time Estimated Time of Arrival (ETA), vehicle details, and route overlays are displayed on the user interface, with automated proximity alerts delivered when matched vehicles approach. The invention improves commuter guidance, reduces wait times, and optimizes fleet usage, offering scalable application across public, private, and emergency transportation networks.

(57) Abstract :

The present invention provides an intelligent, hybrid energy management system named "SunSmart Grid," designed for the efficient and optimized use of solar energy in coordination with battery backup and grid power. The system features a microcontroller-based switching mechanism that dynamically selects the energy source in real-time, prioritizing solar energy, followed by battery, and finally grid power. A smart energy meter monitors real-time load, voltage, and current, supplying crucial data to the control logic. Advanced machine learning models—specifically Decision Tree Regressor, Gradient Boosting Regressor, and Support Vector Regressor—are employed to forecast energy load demand. These predictions help optimize source selection before consumption peaks, ensuring minimal reliance on non-renewable power and maximum utilization of renewable energy. A web-based dashboard developed using Streamlit allows users to interactively visualize energy trends, prediction accuracy, and operational performance. The invention is validated using a hardware simulation that demonstrates energy source transitions and predictive management, making it scalable for deployment in homes, industries, and community grids. This invention significantly enhances the efficiency, reliability, and intelligence of hybrid energy systems, contributing to sustainable and cost-effective energy management.

(57) Abstract :

The invention presents a portable, AI-driven computer device for secure, offline, and automated data analysis and visualization. It enables professionals in remote or high-security environments to ingest data, perform real-time analytics using embedded machine learning models, and generate visual outputs without internet access. The system supports customizable workflows, secure storage, and user authentication to ensure data privacy and integrity. It provides a flexible platform for field-based intelligence gathering, decision support, and autonomous data science tasks.

(57) Abstract :

The invention discloses a portable computing device for dynamic vulnerability analysis, enabling proactive information security management across diverse digital environments. It integrates offline-capable scanning tools, AI-based threat assessment, and secure data handling within a compact, mobile form factor. The device autonomously detects system vulnerabilities, evaluates exploit risks, and provides remediation guidance without relying on cloud services. It supports compliance audits, incident response, and security assessments in both enterprise and field scenarios, offering a secure, efficient, and intelligent approach to mobile cybersecurity operations.

(57) Abstract :

The invention discloses a safe and cost-effective formulation and method for presumptive bloodstain detection, which utilizes readily available household materials, offering a practical and accessible alternative to conventional forensic blood detection techniques. The formulation comprises hydrogen peroxide, a pH adjusting agent, and a fluorescent dye source selected from laundry detergent with optical brighteners, tonic water with quinine, or glow-in-the-dark paint. It is characterized by a dual detection mechanism: a visible bubbling reaction occurs upon contact with hemoglobin in blood, which is complemented by a distinct fluorescent glow under ultraviolet (UV) light due to a fluorescent dye source. Its non-toxic and eco-friendly nature, high cost-effectiveness, accessibility for various settings, and minimized interference with subsequent DNA analysis makes it suitable for field application and educational use.

(57) Abstract :

ABSTRACT A SYSTEM AND METHOD FOR CROP MONITORING AND REAL-TIME DISEASE DETECTION USING AI AND BLOCKCHAIN The present invention provides a system for real-time crop disease detection and prediction, comprising: an image capture device (102) configured to obtain images of plants in an agricultural field; an edge-Artificial Intelligence module embedded into the image capture device (102) that enables the device to identify diseases plants for capturing images, an AI module (104) configured to analyze the images of plants and predict plant diseases; a blockchain network (106) with its ledger configured to store plant disease prediction data and provide secure access to historical disease information; a plurality of reviewer nodes (108) located within the blockchain network (106) and configured to verify and validate predictions, and provide solutions for dealing with plant diseases; a user interface component (110) configured to receive image inputs and provide functionality for plant disease analysis and management; and wherein the AI module (104) is further configured to continually learn based on new data and feedback stored in the blockchain network (106), enabling dynamic adaptation to emerging plant diseases and environmental conditions while maintaining data integrity and traceability through the distributed ledger system. (57) Abstract :

The present invention relates to a novel plasma-based surface treatment system and method capable of inducing controlled transitions between superhydrophobic and superhydrophilic states on a substrate surface. The process utilizes a dielectric barrier discharge (DBD) plasma jet system integrated with organosilicon precursor delivery. Initially, a superhydrophobic film (16) is deposited on the substrate via DBD plasma jet-assisted deposition of organosilicon compounds. Subsequently, without altering the setup or requiring any physical masks, the same DBD plasma jet is employed to convert the surface to a superhydrophilic pattern (17) through direct plasma treatment. This dynamic wettability modification is achieved by adjusting plasma parameters and gas flow conditions alone. Furthermore, the system supports both continuous and pulsed (millisecond on/off switching) control of precursor flow, allowing fine-tuned deposition and functionalization. The invention offers a simplified, mask-free, and highly controllable platform for advanced surface engineering applications, including adhesion enhancement, microfluidics, and flexible electronics. (57) Abstract :

The present invention relates to a portable electronic auscultation system (100) to capture, process, and analyse physiological acoustic sound (102) for diagnosing and monitoring the health of patient (104), comprising an auscultation device (106) configured to capture and amplify physiological acoustic sound (102) generated within body of patient (104), comprising chest piece (202) configured to be placed directly against skin surface of patient (104) for capturing and amplifying physiological acoustic sound (102), and a tubing (204) configured to be operably connected to chest piece (202) for transmitting physiological acoustic sound (102). A transmission module (108) operatively connected to auscultation device (106) comprises an acoustic sensor (302) integrated into the tubing (204) for converting the physiological acoustic sound (102) into physiological acoustic electrical signal (110), converter (304) for generating digitized physiological acoustic signal (112), and communication module (306) for transmitting the digitized physiological acoustic signal (112) to remote computation unit (114).

(57) Abstract :

The invention provides a computer vision-based home security system capable of real-time intelligent intrusion detection and threat analysis. The system uses facial recognition, posture analysis, and object detection to identify unauthorized individuals and assess potential threats. AI-driven threat classification enables context-sensitive responses, reducing false alarms and enhancing residential safety. The system is customizable, learns from user feedback, and integrates with smart home devices and emergency services for a complete security ecosystem.

(57) Abstract :  
ABSTRACT A COLLAPSIBLE BOTTLE WITH LOCKING MECHANISM FOR SPACE-EFFICIENT STORAGE The present invention provides a collapsible bottle comprising a base (102), a neck (104) defining an opening, and a body (106) connecting the base (102) to the neck (104). The body (106) includes a plurality of foldable panels arranged in a kresling pattern, allowing the bottle to be compressed to reduce its volume when empty and expanded to its original volume when filled; a cap (108) configured to engage with the neck, wherein the cap (108) forms an integral part of the bottle when attached; and a locking mechanism (110) comprising at least one protrusion on an inner surface of the cap (108) that engages with a corresponding recess in the body (106) when in a collapsed state. The bottle features a stabilizing structure on the base to maintain an upright position when expanded. The collapsible structure promotes proper disposal, reduces storage space, and enhances portability. Figure 1

(57) Abstract :

The LoRa-Based Gas Monitoring System is a state-of-the-art solution for real-time detection of hazardous gases in industrial environments. Utilizing LoRa (Long Range) wireless technology, this system provides long-range, low-power communication, enabling effective monitoring across large industrial areas without extensive wiring. The system employs a MQ-135 ammonia sensor to detect dangerous gas concentrations and triggers alerts when levels exceed a predefined threshold. Data is wirelessly transmitted via LoRa RA-02 modules to a central receiver. The TTL-to-USB module is used to transfer data from the Arduino Uno to a laptop for further analysis and cloud integration. A user-friendly OLED display provides real-time gas readings with color-coded alerts for safe or hazardous conditions. Data is logged to an SD card for efficient record-keeping, with the option to transfer data to a laptop. This system enhances industrial safety by providing accurate, timely information for operators, minimizing risks, and ensuring quick responses to hazardous gas levels.

(57) Abstract :

[500] Road Transport is considered to be one of the most cost effective and preferred mode of transport. It is vital for economic development and social integration of the country. In India, at the first face, with huge population count, Road Transport Sector accounts for about 87% of passenger traffic due to its easy availability, adaptability, and minimum cost while on another hand day by day it is becoming risky due to heavy traffic intensities and increased frequency of accidents. Facts are dangerous if road accidents count is in concern and it is direct live loss. Driver fatigue is a major contributor to road accidents, resulting in significant injuries and fatalities globally. To resolve this serious issue, the present system provides an innovative and affordable wearable eye drowsiness detection facility through Infra-red sensor-based glasses designed for real-time detection of inattentiveness of driver's eyes which indirectly helps to avoid the chances of road accidents. These are Accident Prevention Glasses (APGs), intentionally designed to combat road accidents caused by driver fatigue. Unlike complex vehicle systems, these glasses offer real-time detection of drowsiness through eye movement monitoring. An IR sensor tracks blinks and prolonged eye closure, triggering immediate audible and tactile alerts via a buzzer and vibration motor when drowsiness is detected. The buzzer uses alternating frequencies to maximize wakefulness. An Arduino NANO microcontroller processes sensor data and manages alerts. The system is programmed using the Arduino IDE and includes predefined thresholds. A lithium-ion battery provides around 13 hours (factual testing result 13.7 hours) of operation. This hardware-based approach prioritises rapid alerts, unlike systems relying on facial recognition. The system resets after each alert, ensuring continuous monitoring. Testing confirms over 90% accuracy in detecting drowsiness under controlled conditions. This system can be also used in medical field, heavy digital screen operators, scientist, Multinational companies wherein consistent eye concentration is mandatory. It is also useful to monitor unconscious patients, detecting movement and triggering alerts and for old age people for their day-to-day activity support where in the person requires helps for his/her eye drowsiness.

(57) Abstract :

Abstract The invention relates to a method for producing A2 high protein, lactose-free milk that is suitable for individuals with lactose intolerance and A1 protein sensitivity. The process begins with sourcing A2-certified milk from native Indian cow breeds or buffaloes, followed by testing for purity and contaminants. The milk is then skimmed, pasteurized, and subjected to ultrafiltration at low temperatures to concentrate native proteins and reduce lactose content. The ultrafiltered milk is treated with lactase enzyme to convert residual lactose into glucose and galactose, making the product suitable for lactose-intolerant consumers. A second pasteurization is performed, and the milk is optionally flavored, bottled in retort-compliant containers, and sterilized at 121°C in a rotary retort. The resulting product is a shelf-stable, naturally high-protein milk free from added milk solids or synthetic protein powders. It retains a pleasant taste and can be used for direct consumption or in the preparation of other dairy products.

(57) Abstract :

ABSTRACT AI based System and Method for Dynamic Pricing in E-Commerce Based on Real-Time Demand and Inventory Levels The present invention relates to an AI-based system and method for dynamic pricing in e-commerce environments, designed to automatically and intelligently adjust product prices in real time. The system utilizes artificial intelligence and machine learning models to analyze a wide range of real-time and historical data, including customer demand patterns, inventory levels, sales velocity, and competitor pricing. By leveraging this data, the system predicts future demand and calculates the optimal price for each product based on predefined business objectives. The system architecture comprises key modules including a real-time data acquisition engine, a demand forecasting model, an inventory analysis component, and a price optimization engine. These modules work together to provide data-driven pricing recommendations that align with inventory status and market demand. A rule validation layer ensures that all pricing decisions comply with business rules, promotional policies, and regulatory guidelines. The system also features a dashboard interface for monitoring and managing the pricing strategy with manual override capabilities. This invention offers significant benefits to online retailers by enabling responsive and intelligent pricing, reducing manual intervention, improving profitability, and maintaining competitiveness. By continuously adapting prices to market conditions, the invention ensures efficient inventory management and maximized revenue, while offering scalability and integration with existing e-commerce platforms through API interfaces.

(57) Abstract :

Artificial Intelligence-Driven Real-Time Public Transport Optimization System for Smart Cities Using IoT Sensors and Machine Learning Techniques ABSTRACT: Urban logistics are essential for the development of smart cities, as they are designed to enhance the sustainability and efficiency of products delivery in urban settings. The demand for advanced technologies to optimise urban delivery systems is on the rise as cities encounter expanding challenges related to congestion, traffic management, and environmental impact. Transportation systems are being transformed by Artificial Intelligence (AI), Machine Learning (ML), and Deep Learning (DL), which are addressing critical challenges such as safety, efficiency, congestion, and sustainability. Urban transport is being transformed by artificial intelligence (AI), which is improving efficiency, sustainability, and the development of smart cities. Cities are confronted with an increasing amount of traffic congestion, pollution, and transportation inefficiencies as a result of accelerated urbanisation. Intelligent traffic management, autonomous vehicles, and predictive analytics are among the AI-driven solutions that have the potential to resolve these challenges. This paper suggests a novel framework that addresses these challenges by integrating artificial intelligence (AI), autonomous vehicles (AVs), and Internet of Things (IoT) technologies.

(57) Abstract :

ABSTRACT Diatoms are microscopic, single-celled algae characterised by their intricate silica cell walls, known as frustules. These frustules serve as valuable tools in environmental monitoring, paleolimnology, taxonomy, and nanomaterials research due to their unique morphological and chemical properties. Along with it, diatoms are also one of the forensic markers which help in the determination of ante-mortem or post-mortem drowning deaths. However, traditional methods for cleaning, etching, and staining diatoms often result in incomplete removal of organic material or damage to their delicate structures. To address these limitations, we present a standard protocol for Ultrasonication-Assisted Chemical Etching and Staining (UACES) of diatoms, designed to enhance the efficiency, reproducibility, and structural preservation of frustule preparation. This protocol employs oxalic acid as the primary etching agent due to its effectiveness in dissolving residual organic and metallic contaminants without significantly altering the silica matrix. The process is aided by low-frequency ultrasonic waves, which improve the penetration and action of oxalic acid by facilitating micro-cavitation, thereby accelerating the removal of unwanted materials while minimising mechanical damage. The controlled etching process enhances the visibility and accessibility of structural features essential for microscopic analyses. Following the etching step, the protocol incorporates a staining step. Each stain targets specific biochemical or structural components of the diatom frustule. Methylene Blue and Gentian Violet provided excellent contrast for traditional light microscopy, while Rhodamine B stood out for its superior illumination and sensitivity under the microscope. The methodology ensures minimal frustule damage, consistent staining quality, and high reproducibility across the sample batches. The versatility of this protocol makes it suitable for forensic applications and a wide range of scientific uses. In conclusion, this standardized UACES protocol represents a significant advancement in diatom preparation techniques. By integrating chemical etching with oxalic acid, ultrasound-enhanced processing, and selective staining, this method provides a robust, reproducible, and versatile approach for the detailed study and application of diatoms in diverse scientific fields. (57) Abstract :

Indian raga classification plays a vital role in the analysis of the different classical notes in the Indian music. It is helpful in analyzing and correcting the musical notes in the songs. This, research work presents the development of portable device for the Indian classical raga identification based on multiple audio features and deep convolution neural network and digital signal processor platform. The multiple acoustic features encompasses the spectral, temporal and voice quality features to characterize the uniqueness in the different raga voices. It uses the novel hybrid combination of Archimedes optimization algorithm and Multi-attribute utility theory algorithm for the selection of salient features. The MAUT algorithm is used for deciding the optimized weights of fitness function of the AOA based feature selection scheme. The Lightweight Deep Convolutional Neural Network is used to classify Indian Ragas which provides improved feature representation and distinctiveness. Finally, softmax classifier is used for raga classification and the performance of the proposed scheme is evaluated using accuracy, recall, precision and f1-score.

(57) Abstract :

The present invention discloses to the development of a strong, intelligent solutions that can protect corporate networks in real time are required due to the growing complexity and number of cyber threats. The deployment of a thorough thread detection system intended to proactively detect and stop harmful activity in corporate settings is presented in this study. In order to identify possible risks such as malware invasions, phishing attempts, insider threats, and unauthorized access, the system continuously analyses network traffic, user activity, and system records using machine learning algorithms and behaviour-based anomaly detection. Minimal operational impact and smooth implementation are guaranteed by integration with the current security infrastructure. The system's ability to shorten incident response times and increase network resilience is improved via real-time warnings, automated reactions, and thorough threat intelligence reporting. The system's potential as a scalable solution for contemporary organizational cybersecurity concerns is confirmed by experimental findings from implementation in simulated corporate environments, which show high detection accuracy and low false-positive rates. Proactive threat management in dynamic networked infrastructures is greatly aided by this study.

(57) Abstract :

A Novel Process of Sprouting and Isolation of Bioactive Peptide from Ragi/Finger Millet and Therapeutic Applications Thereof The present invention provides an optimized and reproducible method for the sprouting of Eleusine coracana (ragi) and the subsequent isolation of bioactive peptides with potential therapeutic applications. Furthermore, the sprouting process involves cleaning, soaking, ambient germination for variable durations (24–96 hours), sun-drying, grinding, and sieving to produce six test samples for analysis. Bioactive peptides are isolated from these samples using an isoelectric point-based precipitation method, where protein extracts are adjusted from an initial alkaline pH (~11) with incremental addition of hydrochloric acid (0.5–1.5 M) until precipitation occurs. In overall, the invention is scalable, cost-effective, and suitable for nutraceutical and functional food applications, with potential extensions to pharmaceutical formulations.

(57) Abstract :

An infrared laser-based facial recognition attendance system (200) and method thereof is disclosed. System includes infrared laser dot projection module (102), infrared camera (202), Artificial Intelligence (AI) facial recognition module (204), dual display module (210), attendance database (212), a real-time dashboard module (214), and a notification module (216). The infrared laser dot projection module is configured at entrance of classroom. The infrared laser dot projection module emits precise dot or structured light pattern onto a face of a student. The infrared camera that is aligned by the infrared laser dot projection module to capture the student's face. The AI facial recognition module is configured to process captured student's face for face detection, and feature extraction. The AI facial recognition module matches face detected and extracted feature against pre-registered facial profiles stored in local or cloud database. If AI facial recognition module match is successful then system marks attendance of student. FIG. 2

(57) Abstract :

The invention discloses a Smart AI Badge System that links physical products to AI-powered digital microsites via embedded QR or NFC tags. Upon scanning the badge affixed to a product, users are directed to a cloud-hosted microsite personalized to that product's identifier. The microsite includes a neural language model-based conversational assistant fine-tuned to deliver branded storytelling, sustainability metrics, care instructions, traceability data, product-specific content and anti-counterfeit validation. The system employs a no-code or low-code backend architecture enabling modular integration with CRM platforms, blockchain, and digital product passports. It facilitates real-time, product-level engagement and transparency, providing scalable, brand-customized experiences across industries including retail, packaging, hospitality, travel, wellness, fashion and gifting. The invention enhances consumer trust, supports ESG compliance, and enables secure digital interaction at the point of use, purchase, or gifting

(57) Abstract :

This invention presents a novel method for enhancing aerobic composting of organic waste using a hybrid bulking system comprising 2–8% synthetic bulking agent (perforated plastic balls) and 8% biochar within an automated in-vessel reactor. The process involves shredding and mixing organic waste with the hybrid bulking system, followed by controlled aeration (0.45 L/min) and thermophilic composting (>55°C) for 14–18 days. Results showed phosphorus loss reduction to 54.35%, TKN retention of 1.99 mg/kg, and optimal C/N ratio of 14–17. The method enhances aeration, reduces nutrient loss, ensures compost maturity, and supports sustainable decentralized waste management.

(57) Abstract :  
Disclosed is a deep learning system (200) for early detection of man-in-the-middle (MITM) attacks in autonomous vehicle networks. Said system comprises data collection layer (201) configured for real-time collection of network traffic data from V2V and V2I communication channels, preprocessing layer (202) configured for cleansing and normalizing network traffic data to ensure consistency, feature extraction layer (203) configured for utilization of Convolutional Neural Networks (CNNs) to identify spatial patterns in the communication packets, temporal analysis layer (204) configured for implementation of Recurrent Neural Networks (RNNs) to analyse sequential data for anomalies, classification layer (205) configured to be fully connected layers to aggregate extracted features and classify traffic as normal or suspicious and alert mechanism (206) for immediate notification to the network control system upon detection of an MITM attack. Further provided is a method for early detection of MITM. It provides high accuracy, adaptability and scalability. Figure 1.

(57) Abstract :  
AN IoT-BASED INTERACTIVE STORYTELLING ECOSYSTEM AND ENACTING METHOD THEREOF An Internet of Things (IoT)-based interactive storytelling for a user is disclosed. The system comprises a smart speaker console configured to output audio narration, sound effects, and receive voice input. The system further comprises a plurality of NFC prompt cards, which include an NFC tag encoding data corresponding to a character, object, event, or narrative decision related to the story. A smart wearable band is operatively coupled with the smart speaker console and is worn by the user. The wearable band includes one or more motion sensors to detect a motion data. Further, a processing unit operatively coupled to the smart speaker console and the smart wearable band is configured to generate interactive narrative content in real time based on user inputs, comprising card scans, voice commands, and motion data. Finally, a mobile application generates interactive narrative content in real time based on processed data.

(57) Abstract :

Composition for coating intravenous cannula, tubes and vascular devices, methods and uses thereof. The present invention relates to composition for coating intravenous cannulas, tubes and vascular devices, methods and uses thereof. The coating composition disclosed herein is suitable for prevention of cannulization or catheterization induced thrombophlebitis. The coating composition provides sustained release of therapeutic agents and reduces health care cost by reducing the requirement for re-cannulation and treatment for thrombophlebitis associated with cannulization or catheterization. (57) Abstract :

Disclosed herein is an improved method for preparation of a multifunctional theranostic nanofiber formulation for targeting cancer. The method, as disclosed herein, provides a nanofiber formulation with enhanced efficacy for both intravenous and intratumoral administration, demonstrating route independence due to the incorporation of an effective tumor-targeting peptide in the nanoformulation. The disclosed nanofiber formulation overcomes the challenges of lower efficacy typically observed during systemic administration, effectively mitigating issues related to protein corona formation and interactions with blood components. Furthermore, the nanofiber formulation enables sustained drug release, ensuring a prolonged therapeutic effect and enhancing treatment efficacy. FIG. 1

(57) Abstract :  
A system for receiving a first frequency band signal using a second frequency band receiver is provided. The system 100 includes antenna 102, frequency processing circuit 104 including low noise amplifier 110, a frequency mixer 112, a filter 116, and a receiver of the second frequency band signal 106. The frequency mixer 112 receives first frequency band signal from the antenna 102 through the low noise amplifier 110 and combines the first frequency band signal with a reference frequency signal to generate a mixer output. The mixer output includes sum frequency component and difference frequency component. The filter 116 isolates the difference frequency component by removing the sum frequency component. The difference frequency component represents the first frequency band signal shifted to the second frequency band. The receiver 106 receives the difference frequency component from filter 116, thereby receiving the first frequency band signal (S-band) using receiver 106 (L-band receiver). FIG. 1

(57) Abstract :

The present invention relates to a method and system for IOT-enabled continuous real-time monitoring of asset health in an industrial environment. The system comprises at least one IOT device (100) positioned in proximity to at least one equipment of the industrial facility, the IOT device comprises a single board computer (110) comprising at least one processing unit (1110) and a memory unit (1120), a user interface unit (120) and an integrated camera unit (130) interfaced with the at least one processing unit (1110). The integrated camera unit (130) comprises at least one RGB camera (1310), at least one acoustic camera (1320) and at least one thermal camera (1330). The system is configured to capture sound waves, visual data and temperature changes in the area and the captured data is fused and analysed in real-time using machine learning algorithms to detect an anomaly in the industrial environment.

(57) Abstract :

The present disclosure provides a system (100) and method (300) that are utilized for assessing uni or multimodal treatment-based intervention in many neurological disorders, such as depression like mood disorders, etc. The system (100) is designed to forecast longitudinal changes in neuro-cognitive behavioral wellness over time, particularly following a few weeks of intervention, such as targeted neuromodulation. The system (100) operates by leveraging data from two initial points: day 0 and approximately 25% into the intervention course, or 1 week, whichever is earlier. By integrating information from cognition, behavior, and brain activity, the system (100) utilizes computational neuroscience and machine learning models to predict after 100% time course of intervention wellness associated with the neuro-cognitive profile, typically of a time length 4-6 weeks. Furthermore, the system (100) possesses the capability to identify abnormal profiles characteristic of neurological and mood disorders, and recommend behavioral and medical interventions suitable for improving wellness.

(57) Abstract :  
ABSTRACT The present invention is a quantum computing system and method are disclosed. The system comprises a processing unit (102) comprising qubit processors or similar circuitry for implementing quantum operations, along with interfaces (104) facilitating communication of signals or data between different logical layers of the quantum computing system. The system further includes engines (106) comprising a combination of hardware and programming. These engines encompass a circuit reception engine (108) configured to obtain gate teleportation circuits for a predetermined number of qubits, a circuit segmentation engine (110) configured to segment the gate teleportation circuits into multiple sub-circuits based on the number of qubits, a gate teleportation engine (112) configured to perform gate teleportation operations on each of the multiple sub-circuits sequentially, and other engines (114) providing additional functionalities as required. This invention introduces a scalable, modular quantum computing system using sequential gate teleportation with circuit segmentation to optimizes depth, reduces decoherence, and improves fidelity, especially on NISQ-class processors. The figure associated with the abstract is Fig. 1.

(57) Abstract :  
The present invention relates to a tyre tread rubber composition comprising oil-treated Fuller’s Earth nano clay as a reinforcing nano filler and a method for its preparation. The rubber composition includes a blend of natural rubber, neodymium catalyzed polybutadiene rubber, and solution styrene-butadiene rubber, in combination with carbon black and/or precipitated silica, resin, coupling agent, and vulcanization additives. The Fuller’s Earth nano clay is treated with process oil such as mustard oil or TDAE oil in the presence of a silane coupling agent to enhance filler–polymer interaction. The composition exhibits improved dynamic mechanical properties including enhanced wet and ice traction, reduced rolling resistance, increased hardness, and improved processing safety. The invention provides a rubber composition suitable for manufacturing tyre treads with superior durability, performance, and reduced environmental footprint.

(57) Abstract :

7. ABSTRACT The present invention relates to a wearable safety system (100) designed to enhance personal security through integrated biometric authentication, real-time location tracking, and multi-sensor monitoring. The system comprises a wearable vest (102) with a plastic waistband and a triangular plastic plate, featuring an adjustable elastic belt mechanism for variable girth. A fingerprint sensor (106) for authorized activation and deactivation, a motion sensor (110) and infrared thermometer sensor for detecting wearer presence and unauthorized removal, and a GSM/GPRS module (112) configured to transmit alerts and GPS location data to pre-stored emergency contacts. The system further includes an audio alarm unit (114) emitting sirens and distress messages, a multi-color LED module (116) for visual alerts, an emergency push button (108), and a rechargeable lithium-ion battery (118) with a charging slot. A microcontroller-based control unit (117) processes sensor inputs and manages communications, enabling energy-efficient operation and timely alerts. The device also preserves foreign fingerprints on its plastic surface for forensic use. The figure associated with the abstract is Fig. 1.

(57) Abstract :

TITLE: Extended End plate composite connection Extended end plate (103) connections are semi-rigid connections, offering advantages in composite structures by facilitating greater moment redistribution and improving seismic performance. However, beam-column connections (101 & 102) are often designed as rigid steel connections, neglecting the potential benefits of composite connections causing disparity between the assumed rigidity of beam column joints in the design phase and their actual behaviour during seismic events. During regular load conditions, the concrete at the top of the beam is expected to handle compression, but under seismic stress, it may experience tensile forces. The installation of extended end plate connections is straightforward, and their behaviour in composite structures demonstrates enhanced ductility and rotational characteristics. Leveraging these rotational characteristics in the design of composite frames aligns with real-world performance, bridging the gap between assumptions and actual behaviour. The rotational properties of extended end plate composite connections, structural performance can be optimized, addressing the disparity between assumptions and reality.

(57) Abstract :

A system and a method for reward allocation based on baggage weight allowance optimization is disclosed. The system (100) comprises a processor (105) and a memory (110) storing instructions executable to generate a unique passenger ID (160) upon registration using multiple authentication details via a user device (125). The processor determines average fuel consumption per unit transported mass using historical airline route data (165) and industry metrics. It computes baggage weight reduction (170) by comparing a passenger's (120) total baggage weight (157) with a threshold allowance. The processor calculates passenger fuel savings (175) as the product of weight reduction and average fuel consumption. It then evaluates a conversion rate using internal parameters, including fuel cost and predefined ratios, to translate fuel savings into reward points (180). The system assigns reward points to the passenger based on their baggage weight reduction, integrating these points with travel profile for incentivized airline operations. FIG. 1

(57) Abstract :

ABSTRACT Title: Novel Synergistic Insecticidal Combinations The present invention relates to a stable oil dispersion (OD) formulation comprising Profenofos in combination with either Acetamiprid or Spinetoram, along with suitable oils, dispersing agents, wetting agents, and stabilizers. The OD formulation is designed to provide broad-spectrum control of insect pests and mites, offering both contact and systemic action. The oil-based matrix ensures superior stability, rain-fastness, and extended residual efficacy, while reducing the frequency of application. The formulation exhibits excellent physicochemical properties, including homogeneity, non-phytotoxicity, and prolonged shelf life under ambient, accelerated, and cold storage conditions. This composition is particularly effective for foliar application in a wide range of crops, contributing to improved pest management and overall crop health.

(57) Abstract :

ABSTRACT Title: Novel and Synergistic Fungicidal Combination The present invention relates to a synergistic fungicidal composition comprising of mandipropamid and at least one more fungicide selected from strobilurin class, cymoxanil, and propineb with at least one agriculturally acceptable excipient in WDG or WP or SC formulation. The synergy of fungicidal composition has the main effective components of mandipropamid with mode of action by inhibiting the biosynthesis of phospholipids and cell wall deposition, thus effectively inhibiting the germination and spread of fungus and with other mode of action by inhibition of ubiquinol oxidase at Qo site or conversion of isothiocyanate, which inactivates the Sulphahydral (SH) groups in enzymes of fungi that can generate efficient synergism.

(57) Abstract :

ABSTRACT Title: Novel Synergistic Herbicidal Combination with Improved Properties The present invention relates to a synergistic herbicidal composition comprising the combination of fomesafen, haloxyfop and imazethapyr in water dispersible granules (WDGs) formulation in an amount of (1-25): (1-20): (1-15) % w/w. The present synergistic herbicidal composition provides enhanced broad-spectrum weed control against sedges, grass and broadleaf weeds. The disclosed formulation exhibits unexpected synergistic effects, leading to improved herbicidal efficacy, lower application rates, and reduced phytotoxicity. The combination is formulated as a water dispersible granule (WDGs) with optimized solvents, emulsifiers, and stabilizers to ensure long-term storage stability, preventing phase separation, crystallization, and sedimentation. The invention also provides a process for preparing the water dispersible granules (WDGs).

(57) Abstract :

ABSTRACT Title: An Improved Herbicidal Combination to Control Weeds Effectively The present invention relates to a synergistic herbicidal composition comprising: (a) metamifop; (b) at least one acetolactate synthase (ALS) inhibiting herbicide selected from penoxsulam, bispyribac sodium, pyrazosulfuron ethyl, and metsulfuron-methyl; and (c) one or more agriculturally acceptable excipients. The composition provides enhanced post-emergent control of a broad spectrum of weeds, particularly in paddy cultivation, with improved efficacy over individual components. The synergistic interaction between metamifop and the ALS inhibitor results in reduced application dosage, improved crop selectivity, and potential delay in the development of herbicide resistance. The invention also provides methods for controlling weeds using the said composition.

(57) Abstract :

ABSTRACT Title: Novel Synergistic Insecticidal Combinations The present invention relates to synergistic insecticidal compositions comprising broflanilide, profenofos, and at least one insecticide selected from lambda-cyhalothrin or spinetoram, along with one or more agriculturally acceptable excipients. The composition provides enhanced insecticidal efficacy against a broad spectrum of insect pests including sucking pests, chewing pests, caterpillars, and borers. The synergistic effect of the combination enables effective pest control at reduced dosages, improved resistance management, and enhanced crop protection in crops such as cotton, vegetables, pulses, and cereals.

(57) Abstract :

A method for preparing a polyherbal composition for alleviating gastrointestinal disorders is disclosed. The method (100) involves selecting a plurality of plant-derived ingredients, including 5g isabgol (plantago ovata husk), 2g amla (emblica officinalis fruit), 0.3g ashwagandha (withania somnifera root), 0.2g black pepper (Piper nigrum fruit), 1g cardamom (elettaria cardamomum fruit), 1g ginger (zingiber officinale rhizome), and 5.5g oats (avena sativa seed). Each plant part is individually cleaned, dried, and pulverized into a fine powder. The powders are then sieved using a predetermined mesh size to ensure uniform particle size. The sieved powders are thoroughly mixed to create a homogeneous polyherbal composition. The final product is stored and packaged for oral administration. This composition offers a natural, synergistic remedy for irritable bowel syndrome (IBS) along with other gastrointestinal ailments through a standardized preparation process ensuring consistency and effectiveness. (57) Abstract :

The present invention provides ternary and quaternary alloy materials having enhanced superelastic and mechanical properties. More particularly, the present invention provides Ti-Zr/ Cu/ Zn based superelastic alloy materials and a method for preparation thereof. The alloy materials are useful in fabricating orthopaedic implants. <>

(57) Abstract :

ABSTRACT AN AUTOMATED PIPELINE DEVICE FOR ANALYSIS AND INFERENCE OF UAV-BASED HYPERSPECTRAL IMAGES OF CROP WATER STRESS The present invention relates to an automated pipeline device equipped with an optimal toolbox for the analysis and inference of UAV-based hyperspectral images of crop water stress. This is an end-to-end automated toolbox, where various data pre-processing steps such as data calibrations like reflectance and geometric calibrations, image quality assessment, denoising, then running analysis algorithms on data like hyperspectral band selection, classification, and inferences generation, water stressed areas mappings in the field are automatically done. Using the device equipped with a toolbox, crop early water stress detection, varied drought stress intensities classification, and water stress areas mapping in the field can be carried out from the UAV hyperspectral images. (57) Abstract :  
SELF-LUBRICATING FORMING TOOL FOR ROBOFORMING ABSTRACT The invention discloses a compact incremental sheet metal forming tool(100) with an integrated lubricant reservoir. The tool is configured to autonomously regulate the contact friction for incremental sheet metal forming. The forming 5 tool includes a hollow shank(101), which hosts a lubricant(102) and provides a lubricant supplying assembly(110) to channelize the lubricant towards a forming assembly(130) that includes a nozzle(134) and a rolling element(132). The lubricant is injected into the tool via a check valve(127) to ensure unidirectional flow and to avoid oil leakage. A 10 compression spring(122) of the lubricant supplying assembly is provided with an disc (125) attached to a seal (124) to exert pressure on the lubricant to maintain uninterrupted flow to a lubricant chamber (126) during forming. The tool is portable and provides reduced contact friction and localized lubrication without wastage or spillage during incremental sheet metal forming operations. 15 FIG. 1A

(57) Abstract :

**ABSTRACT NANOCOMPOSITE AND A PROCESS FOR ITS PREPARATION** The present disclosure relates to a nanocomposite and a process for its preparation. The nanocomposite of the present disclosure exhibits high mechanical strength, high interaction between the surface of the biodegradable implant and bone tissues and improved physicochemical properties. The nanocomposite of the present disclosure, when used in an implant does not cause any side effects to the patient, does not require re-surgery to remove the implant, does not need resection, reduces the degradation of the biodegradable implant, avoids corrosion, and helps to improve the bone healing process. The process for the preparation of the nanocomposite is simple and environmentally friendly.

(57) Abstract :

PROGRAMMABLE METAL-ION BASED HYDROGEL AND ITS SYNTHESIS THEREOF ABSTRACT The present invention provides a programmable metal-ion based hydrogel and synthesis thereof. More particularly, the invention provides a metal ion based hydrogel comprises a combination of lanthanide metal Terbium(III) nitrate [Tb(NO<sub>3</sub>)<sub>3</sub>] and L/D-Aspartic acid and a method of synthesising programmable, circularly polarized luminescent (CPL), nearly 100 % transparent and colourless aspartic acid-lanthanide hydrogels having applications in multilevel data encryption and anticounterfeiting. The exemplary hydrogel and method of the present invention provides several advantages including under the UV light irradiation, different QR codes emitted various luminescence colours depending upon the percentage of doping of Eu(III).

(57) Abstract :  
ABSTRACT SMART WATER AND ELECTRICAL ENERGY CONSERVATION SYSTEM The present invention describes smart water and electrical energy conservation system designed to enable farmers to manage irrigation more efficiently without needing to be physically present in the field. The system consists of various sensors like humidity sensor, temperature sensor, rainfall sensor, soil moisture sensor, and flow control sensor connected to the MM32F3270G8P microcontroller. MM32F3270G8P is a 32-bit microcontroller product based on ARM CORTEX-M3-based microcontroller, selected for its performance, low power consumption, and flexible I/O for sensor interfacing. (57) Abstract :

ABSTRACT ELECTRICAL ENERGY CONSUMPTION ANNOUNCEMENT SYSTEM An electrical energy consumption announcement system comprising of a 3-phase SMPS, RTC, Microcontroller, serial flash memory chip, GPRS modem, LCD display, four channel relay system, a PIR sensor, a battery circuit and an energy metering unit. The microcontroller actively tracks energy consumption, electrical energy usage patterns by reading energy parameters from energy metering unit, and stores this data in serial flash memory chip, and displays this electrical parameters on LCD module, and communicates this data with the server using a GPRS module through secure TCP-IP protocols. (57) Abstract :

Disclosed is a linear profile apparatus 100 that includes one or more linear profiles (102a-102n). Each of the one or more linear profiles (102a-102n) is made up of a translucent material. Each linear profile of the one or more linear profiles (102a-102n) includes a first section (202) and a second section (204). The first section (202) includes a plurality of chambers (402a-402n) such that each chamber of the plurality of chambers (402a-402n) is adapted to enclose at least one member (404). The second section is coupled to the first section (202) and adapted to enclose at least one element (212). FIG. 1

## (57) Abstract :

The Skewness Impact Through Distributional Evaluation (SITDE) method introduces a groundbreaking approach in multi-criteria decision making (MCDM) by addressing the often overlooked skewness in criteria distributions. This research proposes a robust framework that enhances decision-making by incorporating asymmetry, ensuring comprehensive and accurate assessments beyond traditional methods focused solely on averages and variability. The SITDE method's application, particularly in an electric vehicle selection exercise, demonstrated its superiority in producing insightful results compared to conventional approaches. This article establishes the theoretical foundation, practical application, and statistical validation of SITDE, highlighting its effectiveness and reliability in managing complex selection scenarios in MCDM. 4 Claims, 5 Figures. (57) Abstract :  
ABSTRACT RESONATORS HAVING Laterally Stacked Ferroelectric and Piezoelectric Materials Example microelectromechanical systems (MEMS) resonators incorporating laterally stacked multiple ferroelectric and piezoelectric materials and 5 methods for fabricating the same are disclosed. A MEMS resonator (100, 200, 600A, 600B, 700, 800) comprises one or more actuation layers (108, 206, 608) and one or more sensing layers (110, 208, 610) deposited laterally on a first set of electrodes (106, 204, 606). The actuation layers and the sensing layers are made of combinations of distinct ferroelectric-piezoelectric material, piezoelectric-10 ferroelectric material, ferroelectric-ferroelectric material, and piezoelectric-piezoelectric material. In addition, the MEMS resonator includes a second set of electrodes (112, 210, 212, 612) deposited on the actuation layers and the sensing layers such that the actuation layers and the sensing layers are interposed between the first set of electrodes and the second set of electrodes. 15 <> 44

(57) Abstract :  
Title: SMART SYSTEM FOR EARLY DETECTION OF PESTS AND DISEASES IN MANGO ORCHARDS USING AI-BASED SENSORS AND COMMUNICATION MODULES The invention provides anAI-based smart system for early detection of mango pests and diseases. It uses acoustic, temperature, and humidity sensors to monitor mango s orchards. Data is processed through a deep learning classifier for anomaly detection, and pest trapping mechanisms are activated. Real-time alerts are sent to farmers via GSM or IoT platforms, enabling timely interventions. The system ensures precision agriculture, reduced crop losses, and environmental sustainability. (57) Abstract :

A novel water-soluble packaging film has been developed using a biodegradable composition comprising guar gum, hydroxyethyl cellulose (HEC-1), Aloe barbadensis extract, glycerin, and sorbitol, with deionized water as the solvent. The ingredients are mixed, heated, cast, and dried under controlled conditions using a solution casting method to produce a semi-transparent, light yellowish, smooth-surfaced film. This environmentally friendly film dissolves completely in water within 45 minutes at 40°C, leaving no harmful residues, making it suitable for sustainable packaging applications. The film demonstrates optimal load-bearing capacity for items weighing up to 500 g and maintains its texture and integrity during extended storage. This innovation provides a promising eco-friendly alternative to conventional single-use plastic packaging, contributing to the reduction of plastic pollution.

(57) Abstract :

ABSTRACT A CONSTANT PRESSURE PUMP FOR MICROFLUIDIC APPLICATIONS The present invention provides a constant pressure pump system (100) for microfluidic applications that uses pressure of the deadweights (40) for the working of the pump system (100). The system (100) of the present invention eliminates use of power or bulky accessories. The working pressure can be changed easily by changing the deadweights (40). Reference Figure 1

(57) Abstract :

This study presents the synthesis and characterization of GdH-doped tin tantalum borophosphate (Sn-Ta-BP) glass for dual applications in gamma shielding and white light emission. Gadolinium (GdH) is chosen for its high atomic number and luminescent properties. The glass samples were prepared using the melt-quenching method and analyzed for structural, optical, and radiation shielding characteristics.X-ray diffraction (XRD) and Fourier-transform infrared spectroscopy (FTIR) confirmed the amorphous structure. UV-Vis-NIR absorption and photoluminescence (PL) studies revealed broad white light emission due to energy transfer between Gd<sup>3+</sup> ions and the glass matrix. Gamma shielding efficiency, evaluated via mass attenuation coefficients (lfp) using XCOM software, showed enhanced performance due to the presence of Gd<sup>3+</sup> and high-density elements like tantalum.The combination of efficient gamma shielding and white light emission makes this glass ideal for applications in radiation protection and optoelectronics. Future work will focus on optimizing the dopant concentration and assessing performance under varying radiation energies.

(57) Abstract :  
The present disclosure relates to a basalt fabric reinforced cementitious composite (BFRC), designed for applications such as strengthening applications. The composite (100) comprises fibrous (102) and non-fibrous mortars (106), where the fibrous mortar (102) contains mono and hybrid fibers selected from basalt fibers, alkali-resistant glass fibers, or combinations thereof. The non-fibrous mortar (106) is prepared with a cement binder, optionally partially replaced with Alccofine. A fabric (104) includes bidirectional mesh with a 25 mm size and/or unidirectional mesh with a 5 mm size. The water-to-cement ratio is 0.45, and a polycarboxylic ether-based superplasticizer is used. The composite (100) is optimized for achieving improved tensile and bond strength and also durability, ensuring performance for specific application needs. Figure 1 will be the reference.

(57) Abstract :

Disclosed is a blockchain network system (100) and method (200) for secure digital information, includes a plurality of nodes (102) configured to receive transaction data from users. Each node includes a cryptographic hashing engine (104) that integrates Secure Hash Algorithm (SHA) and Message Digest (MD) functions to produce unified hashes for digital signature generation. A data embedding engine (106) embeds these signatures into data using metadata injection or substitution techniques. A cryptographic encryption engine (108) encrypts digital assets before recording them onto the blockchain. A zero-trust security engine (110) enforces identity verification for all participants prior to transaction execution or data access. Additionally, a watermarking and steganographic engine (112) applies tamper-resistant watermarks and conceals data within digital media. Figure 1 will be the reference.

(57) Abstract :  
ABSTRACT A MAGNETICALLY TUNABLE SYSTEM AND METHOD FOR THERMAL DIFFUSIVITY IN HEAT TRANSFER NANOFLUIDS The invention relates to a magnetically tunable nanofluid system (100) for modulating thermal diffusivity, enabling selective heat dissipation or confinement via magnetically controlled thermo-optic effects (200). It provides a method for tuning thermal diffusivity in binary or ternary nanocomposites (107) dispersed in water. External magnetic fields from Neodymium magnets (108) induce alignment and aggregation of ferrimagnetic, paramagnetic, and diamagnetic nanoparticles, leading to clustering, restricted Brownian motion, and thermal percolation. A dual-beam thermal lens spectroscopy technique enables real-time diffusivity modulation. Experimental results show thermal diffusivity ranging from (0.61±0.05)×10<sup>-7</sup>m<sup>2</sup>/s to (14.50±0.20)×10<sup>-7</sup>m<sup>2</sup>/s. Optical microscopy and FESEM analyses confirm thermally conductive nanoparticle networks formed by chaining and clustering (400–800). The system supports dual-mode functionality—serving as either a thermal coolant or insulator—by adjusting nanoparticle composition and magnetic field strength. The invention enables dynamic control of heat flow in heat exchangers, electronics cooling, and medical hyperthermia applications. (Figure-1 for Abstract)

(57) Abstract :

The present invention relates to a biodegradable, water-soluble packaging film composed primarily of seaweed extract, guar gum, hydroxyethyl cellulose (HEC), aloe vera extract, sorbitol, and glycerin. The invention provides a method for preparing a homogeneous film-forming solution, casting the film, and achieving controlled drying and conditioning to produce a soluble, flexible, and mechanically stable film. The film demonstrates excellent tensile strength, tear resistance, burst resistance, and water solubility, with complete dissolution in water within 45 minutes. Its moderate water vapor transmission and permeability make it suitable for packaging applications that require both moisture resistance and breathability. The film is safe, eco-friendly, and capable of being manufactured at industrial scale using a low-cost, solvent casting method without requiring specialized equipment. Applications include sustainable packaging for food, personal care products, agricultural chemicals, and single-use dissolvable sachets.

(57) Abstract :

The present disclosure relates to a method for producing fermentable sugars, including xylo-oligosaccharides (XOS) and gluco-oligosaccharides (GOS), from corncob biomass without requiring pretreatment. The process involves separating corn-cob pith using a high-speed steel drill bit, followed by enzymatic hydrolysis using xylanase and cellulase in optimal buffer solutions, maintaining a liquid-to-solid ratio. The mixture is saccharified, which ensures efficient sugar recovery due to the low lignin content and porous structure of corn pith, with particle sizes between 0.5–2 mm and 5–10% moisture content. The enzyme concentrations range from 5–50 U/mL. This technique achieves high yields up to 89% for XOS and 98.8% for GOS equating to 40–70 g/kg and 20–50 g/kg of corn-cob pith, respectively. The invention eliminates costly pretreatment, reduces environmental impact, and enhances the industrial feasibility of bioconversion processes. Fig 1.

(57) Abstract :

Disclosed is a real-time speech recognition and interpretation system aids individuals with speech impairments. The system comprises an IoT assembly with a high-fidelity microphone, push button, display, microcontroller, transmission unit and powered by battery which captures unstructured speech. A secure cloud application with multilingual models and cross-platform compatibility receives data via an IoT gateway. A real-time speech processing unit converts audio to text using Automatic Speech Recognition and linguistic refinement. Secure data transmission with encryption and access control is ensured. A performance monitoring unit tracks accuracy and optimizes functionality based on feedback, facilitating effective communication. The present invention disclosure also provides a method for real-time speech recognition and linguistic interpretation for individuals with speech impairments. Figure 1 will be the reference.

(57) Abstract :

A DISINFECTANT THREE-WAY SYRINGE UNIT FOR DENTAL CHAIR SPITTOON HYGIENE ABSTRACT A disinfectant three-way syringe unit (100) for dental chair spittoon 5 hygiene is provided. The disinfectant three-way syringe unit (100) includes a first three-way syringe (102a) to deliver a controlled stream of air and water, a second three-way syringe (102b) to disinfectant a spittoon (110), a first booster bottle (104) for supplying water to plurality of handpieces and the first three-way syringe (102a), a second booster bottle 10 (106) to disinfect the spittoon area, a compressor (108) for supplying compressed air to operate a plurality of handpieces, one or more air syringes, a spittoon bowl (110) for rinsing water and spitting during treatment, and an assistant instrument tray (114) for allowing a dental assistant to handle a plurality of instruments, a dental hose (112) for connecting a plurality of handpieces, air-water syringes, and suction devices to the dental chair (119), for ensuring easy and controlled delivery of air, water, and suction during treatment. (57) Abstract :

The present invention relates to aherbal nanogel formulation for promoting hair growth, and a method for preparing the same. The nanogel is prepared by encapsulating the piperine in polymeric nanoparticles, demonstrating improved stability and skin permeability. The prepared nanogel formulation is subjected to characterization, wherein Particle size, morphology, encapsulation efficiency, and stability are assessed. The efficacy of the prepared nanogel formulation is evaluated using an in-vivo study, wherein sample of nanogel formulation is administrated to subject animal, for a time period 28 days, along with a control and standard group. The results from in-vivo study revealed the effect of formulation on hair growth, wherein parameters like hair length, density, and follicle count are analysed. The results revealed that the administration of prepared piperine based nanogel formulation enhanced the hair growth, facilitated faster follicle activation.

(57) Abstract :

The present invention relates to a smart IoT-based mobile charging system that automatically cuts off power supply when the connected mobile device is unplugged. The system comprises a standard charging interface, a current sensor module, a microcontroller (e.g., ESP32), and a relay-based power control circuit. Upon detecting zero current flow due to device removal, the microcontroller triggers the relay to disconnect power, preventing idle energy consumption. This design ensures enhanced safety, energy efficiency, and extended hardware life by eliminating unnecessary power draw. Unlike existing smart plugs, the system operates without internet connectivity or external cloud services. The compact and cost-effective design makes it ideal for households, hostels, offices, and rural areas. An optional indicator may be included to visually signal charging or disconnected states. The invention provides an autonomous, user-friendly solution for intelligent mobile charging control.

(57) Abstract :

The invention is a modular barricade system with electromagnetic interlocks, replacing conventional fasteners. Each module has built-in electromagnetic lock housings on multiple sides for quick, tool-free connection. A wireless control unit manages these locks remotely, ensuring security and fast emergency disengagement. Internal wire slits conceal electrical connections, while integrated power management and control logic circuits handle power delivery and remote commands. The design improves reliability, cuts maintenance, and suits crowd management, traffic control, and security needs.

(57) Abstract :  
Fig. 1 is an exemplary embodiment of the disclosure which illustrates the working of the overall PRIOR+ redistribution framework (100), wherein the Food Donors Interface (110) and the Recipient Interface (120) serve as data intake components. These interfaces feed real-time surplus food availability and recipient demand into the PRIOR+ Redistribution Engine (130). The redistribution engine generates optimized matches and delivery strategies, which are passed to the Logistics/Delivery Platform (100) to enable efficient dispatch. A Feedback Learning Loop (140) continuously refines the redistribution logic based on delivery success and resource utilization metrics, ensuring adaptive and intelligent redistribution over time.

(57) Abstract :

The present invention discloses a mechanically operated Ergonomic Gripper (100) designed to improve user mobility, comfort, and stability. The invention comprises an ergonomically contoured handle (101) for enhanced grip, a telescopically adjustable central shaft (102) to suit users of varying heights, a manual grip lock (104) for secure height fixation, and a base assembly (105) with stabilizing fins (103) to ensure superior balance and anti-slip performance on diverse terrains. The walk stick is constructed entirely with mechanical components and does not incorporate any electronic or sensor-based elements. It is particularly suited for elderly individuals or those requiring physical support during movement, offering a durable, lightweight, and maintenance-free solution for improved walking assistance.

(57) Abstract :  
The present invention relates to the design of real-time skin analysis and personalized skincare recommendations. The primary purpose of the system is to enhance skincare awareness and support early detection of dermatological conditions. It features an integrated camera for capturing facial images, a facial recognition module, and a machine learning model trained for skin condition detection. The system extracts key facial features and analyzes them to identify issues such as acne, pigmentation, and dryness. Based on the analysis, it generates customized recommendations to improve skin health. Results are displayed instantly on an embedded LED screen within the mirror. This seamless and interactive solution offers users immediate, accurate, and personalized skincare insights. Figure 1 is an exemplary embodiment of the disclosure, illustrating the overall design and workflow of the AI-powered dermatology display system integrated into the Skinscope Mirror (100), including Image Capture (101), (ii) Face Recognition & Feature Extraction (102), (iii) AI Analysis (103), (iv) Recommendation Generation (104), and (v) Result Display (105).

(57) Abstract :

The present invention relates to a system and method for providing personalized Vedic mantra recommendations based on the analysis of a user's vocal frequencies. The system captures voice input through a microphone, processes the audio to remove noise and normalize signals, and extracts key vocal features such as pitch, tone, and resonance. An AI engine compares these features against a predefined database of Vedic mantra frequencies, identifying the most appropriate mantras based on vocal compatibility and emotional relevance. Fig. 1 is an exemplary embodiment of the disclosure which illustrates the working of the voice-based therapeutic system (100), wherein the voice feature extraction module (101) receives a user voice input and extracts a set of parameters including fundamental frequency (in Hz), spectral centroid (timbre), harmonic count, and voice texture. These extracted voice features are communicated to the speech emotion recognition module (102), which processes the input to determine the emotional state of the user, identifying indicators such as stress, calmness, sadness, energy level, and other relevant voice parameters. Based on the recognized emotional attributes and vocal characteristics, the therapeutic mantra recommendation module (103) generates a suitable mantra suggestion intended to provide a healing effect or protective influence, thereby offering personalized auditory therapy aligned with the user's emotional condition.

(57) Abstract :

A Real-Time Multimodal Input-Based Assessment System (100) comprising; a student interface (110) configured to receive input via one or more modalities selected from the group consisting of speech and gestures; a processing module (120) operatively coupled to the student interface (110) for converting the received input into standardized text; and a scribe interface (130) for displaying the standardized text in real-time for human interpretation or transcription;

(57) Abstract :

The Compact Door Stopper with Integrated Room Freshener Dispensing Mechanism is a multifunctional unit combining the functionality of a door stopper and a room freshener dispenser. In an exemplary embodiment, it is floor-mounted and includes two slots; a first slot that acts as a standard door stop, and a second slot activates a fragrance system when the door is pushed further. The system includes a refillable fragrance container, a spring, a nozzle, and a pedal lever. The compact, dual-purpose design saves space and enhances convenience, making it suitable for both residential and commercial use.

(57) Abstract :

The invention relates to a pair of smart socks designed to monitor and analyze real-time sweat and metabolic activity of the wearer. These socks incorporate integrated sensors embedded within the fabric to detect various physiological parameters, including sweat composition and skin temperature. The data captured by these sensors are transmitted wirelessly to a connected mobile application, which provides users with real-time insights into their health status. The system leverages microfluidic channels to facilitate the collection and analysis of sweat samples, enabling non-invasive monitoring of metabolic processes such as hydration levels, glucose levels, and other biomarkers. The mobile app serves as a central hub for visualizing data trends, offering personalized health recommendations based on the analysis. This invention aims to improve user well-being by providing actionable health data in a convenient and non-intrusive form.

(57) Abstract :

The Under-Shelf Organizer with Adjustable Guideways and Integrated Sanitization Unit is a multifunctional kitchen storage solution designed to securely mount beneath shelves of varying thicknesses. It features a spacious tray for general storage, an integrated spoon stand for organized utensil placement, and a built-in UV light for effective sanitization. The dual guideway system ensures enhanced stability, while the structure allows for easy access and cleaning. This design offers a compact, hygienic, and space-efficient solution ideal for modern kitchen environments.

(57) Abstract :  
This invention introduces a Multi-modal Framework for Emotional Alignment and Productivity enhancement application that transforms auditory experiences through dynamic adaptation. By integrating user text input, psychological brainwave analysis, and reinforcement learning, the system generates real-time, emotionally intelligent music. A central Decision AI module interprets emotional and cognitive states, while a multi-modal framework fuses brainwave signals, textual data, and audio preferences without hierarchy, allowing seamless synthesis. At its core is an adaptive beat generation engine, continuously evolving the soundscape to match the user’s inner world. Unique to this invention is a reinforcement learning module that personalizes music with increasing precision based on user feedback and behavior over time. The system provides an intelligent, interactive, and evolving sonic environment—perfectly tuned to enhance productivity, induce relaxation, or deliver deeply immersive listening.

(57) Abstract :

This invention produces an accessory system consisting of safety padding for children who stands frontward on the scooter and an attached storage compartment which enhances safety measures and storage convenience. This accessory possesses adjustable elastic bands and secure fastening straps together with an integrated basket that measures about 30 cm wide. This accessory design enables users to see vital scooter controls which supports operations while reducing accidents. The solution caters specifically to scooter users with children because it is portable while remaining lightweight while also being washable and universally adaptable.

(57) Abstract :

The present invention relates to a radar-based nap timer that uses continuous-wave (CW) radar technology to monitor sleep patterns and determine the optimal time to wake the user. The system comprises a radar transceiver that emits low-power radio frequency (RF) signals and analyses the reflected signals to detect micro-movements associated with respiration and body motion. A signal processing unit processes this data and transmits it to a sleep stage detection unit, which classifies the user's sleep stages and identifies the optimal wake-up point to minimize sleep inertia. The system further includes a wake-up mechanism that triggers an alert to gently wake the user and a user interface that allows manual configuration of nap duration or automatic optimization based on detected sleep patterns. By dynamically adjusting detection parameters according to user preferences, the system enhances nap efficiency and provides a non-contact, user-friendly solution for improving alertness and cognitive performance.

(57) Abstract :

A light-illuminating Jhumka (100) is specifically designed for young girls, integrating aesthetics with functional lighting in a wearable form. This innovative accessory features a compact electronic circuit embedded within a traditionally styled "Jhumka," consisting of a low-voltage LED (103) powered by a 3V battery (105) and controlled through a manual switch (104). A key element of the design is the use of a coconut shell-based upper casing, which serves as a natural electrical insulator, enhancing safety and comfort for the wearer. The light can be activated or deactivated with ease, offering both decorative appeal and practical utility in dimly lit or emergency situations. By combining ornamental value with user-friendly operation and safety- focused material selection, the system offers a novel, eco-conscious solution tailored for children's daily wear.

(57) Abstract :

The invention (100) discloses a hair oil applicator with an integrated scalp massager designed for precise, hygienic, and controlled oil application. It features a ball (101) that dispenses oil only when pressed, minimizing friction and irritation compared to traditional roll-on applicators. An oil applicator (102) ensures even distribution of oil while providing a gentle massaging action to promote scalp health and stimulate hair growth. A spring (103) positioned beneath the ball regulates oil flow by compressing under pressure, preventing leakage and excessive application. The oil container (104) securely stores the oil and is designed for durability, portability, and ease of use. The applicator may also include a flexible tube inside the container for better maneuverability, allowing users to easily reach all scalp areas. Together, these components offer a mess-free, efficient, and user-friendly solution for hair oil application.

(57) Abstract :

The intelligent irrigation system is designed to optimize water usage in agriculture and landscaping by automating the irrigation process. It consists of a control unit that monitors soil moisture and weather conditions, ensuring precise water distribution. The system is powered by a power source and an integrated solar panel for energy efficiency. The control unit includes indicators such as the power indicator, solar indicator, and full water indicator to provide real-time system status. Soil moisture sensors and weather sensors help determine irrigation needs, minimizing water wastage. A mobile app allows remote monitoring and control of irrigation schedules. The system operates through drip irrigation lines to deliver water directly to plant roots. By integrating automation and renewable energy, this system ensures sustainable water management, reduces manual labor, and enhances crop productivity while conserving water resources.

(57) Abstract :

The present invention relates to a portable health monitoring device (100) designed to measure multiple vital health parameters in one compact unit. The device is powered by a battery (101) and includes bioimpedance sensors (102) to assess body composition and hydration levels. An Arduino Uno board (103) controls the operation, collecting data from the sensors. Infrared sensors (104) enable non-contact temperature detection, while an MLX9061 thermometer (105) provides accurate body surface temperature readings. Additionally, an oximeter hole (106) is provided for measuring blood oxygen saturation (SpO2) and pulse rate. The integration of these components allows users to perform quick, reliable, and complete health checkups at home or on the move, eliminating the need for multiple separate devices. The design ensures easy use, portability, and effective health monitoring for personal or professional healthcare purposes.

(57) Abstract :

Yoga Mudras, a significant part of yoga, involve specific hand gestures that are believed to influence energy flow within the body, promoting healing and balance. The accurate practice of mudras is crucial for achieving desired benefits. This research proposes developing an AI-powered mobile application, "Healing Hands," to provide real-time recognition and correction of yoga mudras. The application will use CNNs to recognise and provide feedback on user-performed mudras, empowering individuals to learn and practice mudras effectively, promoting holistic well-being.

(57) Abstract :

This invention Smart Recycling System For Fabrics presents a novel. The proposed system combines the strengths of CNN for detecting the condition of the fabric and the condition of the fabric. Then Decision tree is used for deciding the category of the clothes to be recycled either as reusable one or recyclable one .If reusable one the decision for new clothing is given to the user for deciding what type of clothes to be done. If it is a recyclable one the options of carpetbag or others option is given based on the condition. The design suggestion is given by GAN .Once the design suggestion is approved by the customer it is done and finally defect detection is done by SVM algorithm. The final logistics and distribution is taken care by the optimization algorithm Soothe elevation of complete design (100) of a model for customer side(101) data information and the AI model (107).Fig 2 is an exemplary embodiment of disclosure which illustrates the comprising steps registration (102),clothes collection (103),user feed requirement (104),user response for the model suggestion on clothes (105),payment gateway(106). Fig 3 illustrates the final component of the AI trained model to generate clothes based on the condition of the material using CNN (108), decision (109), defect detection (111) and finally logistics by PSO (112).

(57) Abstract :

This invention provides a comprehensive waste management system by combining modern sensor technologies, app applications, and data analytics. The system implemented consists of smart dustbins with weight and odor sensors that track the amount of trash in real time and alert the user via a app application when the trash reaches 75% full or starts to smell bad. Users are able to request pickups using the application, and the back-end system will send out a crew to pick them up. After being gathered, the waste is taken to a warehouse for recycling and segregation. By enhancing waste collection procedures with no environmental damage and encouraging proper waste disposal, this approach removes the inefficiencies of the earlier waste management methods and increases user engagement.

(57) Abstract :

The present invention introduces an AI-powered personalized learning assistant that dynamically adapts educational content by analyzing real-time user engagement and emotional responses. The system integrates an eye-tracking module to monitor gaze patterns and a sentiment analysis module to assess emotional states through facial expression analysis. A content adaptation engine processes this data and modifies content format, difficulty, and pace to optimize learning outcomes. Additionally, a machine learning model continuously improves system performance by analyzing historical user data to refine content recommendations. The system provides an intuitive user interface that displays real-time feedback and allows manual configuration to enhance personalization. By leveraging these technologies, the invention ensures an adaptive and highly engaging learning experience, improving knowledge retention and user satisfaction.

(57) Abstract :

The present invention relates to an intelligent system and method for automatically generating structured lecture notes from live faculty speech. The rapid growth of AI has increased the dependency of learning community on AI generated contents for understanding lectures. The procedure is time consuming and more tedious when multiple lectures are involved. To reduce the time invested and to improve the relevance and accuracy of notes this model captures the audio clips, extracts keywords and connect with AI tools to create enriched contents. The generated contents will be further verified, formatted by incorporating relevant formatting tools and exported to required formats. The model can be effectively used by teaching as well as learning community to make the learning process more efficient, effective and impactful.

(57) Abstract :

The invention is a smart flame detection and emergency alert application using video processing and geo-location. It analyzes real-time footage to detect flames, then sends emergency alerts with location data to contacts and services. This system offers efficient, cost-effective fire monitoring, enabling rapid response in unattended or high-risk environments. Fig 1 is an exemplary embodiment of disclosure which illustrates the working of the IoT- based system (100), where the sensor unit and input interface (101) collects gas concentration data, temperature and humidity readings, and color/visual data, interfacing with the IoT-based system (102) for freshness and rot status detection

(57) Abstract :

A PORTABLE HEAD-MOUNTED DEVICE FOR VISUAL ACUITY TEST AND A METHOD OF TESTING VISUAL ACUITY ABSTRACT 5 A method (300) of testing visual acuity and colour blindness is provided. The method (300) includes switching (302) ON the portable head-mounted device (100), displaying (304) Snellen chart letters and digital colour blindness screening plates on TFT displays (102a/102b), allowing (306) a user to read Snellen chart letters displayed on the TFT displays (102a/102b), changing (308) Snellen chart letters displayed by the user using at least one of a push button (108a/b), observing (310) the displayed visual acuity measurement in an OLED display (106), testing visual acuity of the user based on reading of the Snellen chart letters by the user and determining a visual acuity of the user by recording a smallest readable line displayed on the OLED display (106), screening (312) the colour blindness of the user based on reading of one or more colour blindness images displayed to the user via one of the TFT displays (102a/102b). (57) Abstract :

The invention provides a smart ceiling fan system with a load-sensitive safety alert mechanism that detects abnormal load conditions using a load cell, processes data through a microcontroller, and triggers real-time alarms, enhancing safety by preventing potential structural failures and ensuring timely alerts in various environments. Fig 1 is an exemplary embodiment of disclosure which illustrates the physical setup of the smart ceiling fan system (100), which comprises a ceiling fan (101), a load cell (102) to detect weight changes, an HX711 amplifier module (103) to process the load signal, an ESP32 microcontroller (104) for data processing and communication, and an alarm unit (105) for alerting.

(57) Abstract :  
The rapid growth of Internet of Things (IoT) devices has necessitated the development of efficient computational architectures to manage the inherent latency challenges associated with real-time applications. This work uses a novel edge-cloud orchestration framework specifically designed for latency-sensitive IoT systems. By leveraging a hybrid architecture that seamlessly integrates edge computing resources with cloud services, our approach optimizes data processing and resource allocation based on real-time analytics and user-defined latency requirements. Hybridized meta-heuristic algorithms are used to enhance the optimization results.

(57) Abstract :

Abstract The primary objective is to overcome common challenges encountered during agricultural cultivation and transportation, particularly those related to time consumption and operational cost Specific problems addressed include the high cost and time involved in spraying pesticides and tire deflation in agricultural fields. A pneumatic system is developed using a compressor that converts mechanical power from an engine into pressurized air. The compressed air is stored in a tank and utilized for multiple purposes. Primarily, the air is used to inflate deflated tires in the field. Additionally, it is employed to spray pesticides, fertilizers, and herbicides through sprayer nozzles connected to a 20-litre storage tank. The system is implemented on a mobile trolley setup consisting of an engine, air compressor, pesticide storage tank, and spraying unit This setup serves as a prototype to evaluate the performance characteristics of the system. The compressed air can also be redirected for use as a pressure washer for cleaning agricultural vehicles or equipment and for small-scale spray painting. The air storage tank (1 0 litres) takes approximately 42 seconds to reach a pressure of 70 kg/cm2• The spraying system is capable of covering approximately 1.4 acres of farmland in one hour .

(57) Abstract :

The invention relates to a modular control apparatus designed to retrofit conventional gas stove knobs for automated and remote operation. The system features a servo-driven dynamic rotor that mechanically depresses and rotates the knob to enable ignition, addressing limitations of existing smart knobs that lack press-to-ignite capability. A custom modular knob with interchangeable couplers ensures compatibility with various stove types. Integrated sensors, including flame, temperature, and microphone modules, enable real-time monitoring for features such as boiling detection and whistle counting. Controlled via a mobile application, the system offers programmable cooking, safety alerts, and automated shutoff, all without modifying the stove's internal structure. The invention provides a cost-effective, non-intrusive solution for enhancing kitchen safety, convenience, and intelligent cooking control

(57) Abstract :

Abstract The primary objective is to design and fabricate the Powertrain system of an All-Terrain Vehicle (A TV) along with its Wheels and Braking system. The main focus is to develop a single-seater, high-performance off-road vehicle capable of handling rugged terrains while ensuring maximum safety and driver comfort. The vehicle is engineered to generate sufficient power to traverse . rough landscapes with minimal effort. With the growing adoption of alternative powertrains, selecting the most appropriate configuration for a specific vehicle class becomes a significant challenge. The powertrain is constructed to tow up to 1 ton and is designed and validated through analytical calculations. Physical analysis determined the suitable gear reduction required to achieve the targeted top speed and torque. The braking system is engineered, analyzed, and integrated to deliver high-efficiency performance with minimal driver input, regardless of terrain conditions. It plays a crucial role in the vehicle's overall drivability. The brake design process involves evaluating various operating conditions to ensure optimal effectiveness. The A TV also emphasizes efficiency in multiple aspects, including driver safety, costeffectiveness, durability, ease of maintenance, and suitability as a robust transportation solution in off-road environments.

(57) Abstract :

ABSTRACT: The present invention relates to systems and methods for predicting cognitive and behavioural patterns among social media users engaged in digital learning. The system captures and analyses multimodal data, including textual posts, comments, interaction metrics, and visual media from multiple social media platforms such as YouTube, Instagram, Twitter, and Reddit. Utilizing a hybrid artificial intelligence model that integrates Natural Language Processing (NLP), facial emotion recognition, and time-series deep learning, the system generates a dynamic Learner Profile Vector (LPV) that reflects real-time cognitive engagement, emotional state, and behavioural trajectories. The hardware-software architecture comprises a Multi-Channel Data Acquisition Unit interfaced through APIs for continuous data extraction, an Edge AI Processing Module or cloud-based engine for realtime preprocessing and noise reduction, and a Deep Learning Processor Core equipped with GPUs or TPUs to execute LSTM and attention-based neural networks. Secure Storage employing relational or NoSQL databases maintains learner histories and pattern logs. An Adaptive Recommendation Engine delivers personalized learning interventions via preferred social media channels, while a Visualization and Alert Dashboard provides actionable insights to educators and stakeholders. The invention supports scalable, privacy-aware, and adaptive monitoring, ensuring cognitive alignment and emotional wellbeing in decentralized social media learning environments.

(57) Abstract :

The present invention provides a smart, automated turn signalling system that is designed for bicycles and small vehicles which enhances road safety by using navigation data to activate directional indicators. The system consists of an ESP32 microcontroller, a mobile application, and LED indicators. The mobile application allows the user to select a destination and fetches route data including turning points using a navigation API such as OpenRouteService. The ESP32 continuously receives live GPS coordinates from the mobile app and compares them to the upcoming turn nodes. When the vehicle approaches a turn, the ESP32 activates the corresponding LED indicator and buzzer. After the turn is completed, the system automatically turns off the signal. This hands-free solution removes the need for manual input. The system is housed within a lightweight structure attached to the bicycle which is powered by a portable power source and includes an LCD for live feedback. It is scalable and energy efficient. It is also customizable for multiple vehicle types. By automating turn signalling, the invention reduces the distraction of drivers and enhances safety while navigating in a urban or high traffic environments.

(57) Abstract :

Abstract Polymer-based fluorescent nanomaterials have been broadly in the spotlight because of their variability, biocompatibility, and fluorescent properties that formulate them highly appropriate for a broad array of biomedical applications. The emergence of antibiotic-resistant bacteria and the urgency to find cancer therapies specifically targeting call for the synthesis of multifunctional nanomaterials that combine fluorescence with antibacterial and anticancer activity. These materials represent a significant milestone, bringing together traditional therapies and cutting-edge nanotechnology to enable future therapeutic and diagnostic functions, functionalized fluorescent polymer dots were also prepared in this research work through a single-step hydrothermal process from a polyvinyl alcohol (PVA) precursor. Morphological examination confirmed that they are spherical particles with diameters smaller than 10 nm. Optical characterisation demonstrated significant UV-blue light absorbance and extensive visible light emission. The nanodots synthesised showed effective bactericidal activity against gram-positive and gram-negative bacteria. They also expressed anticancer activity against A549 lung cancer cells with minimal cytotoxicity against HEK 293 cells. Their optical properties also render them good prospects for application in diagnostic imaging as well as light-based medical devices.

(57) Abstract :

The present invention discloses an AI Optimized Demand Forecasting and Inventory Balancing System designed to enhance the resilience, agility, and efficiency of modern supply chains. It addresses critical limitations in traditional forecasting and inventory planning systems by introducing a unified, intelligent platform that integrates machine learning, predictive analytics, and adaptive optimization techniques. The system is capable of ingesting and processing high-volume, high-velocity data from diverse internal and external sources including sales history, inventory records, supplier performance, market trends, seasonal factors, and real-time disruptions to generate highly accurate, context-aware demand forecasts across multiple levels of a supply network. The core of the invention comprises a hybrid AI forecasting engine, combining time series models, deep learning architectures, and causal inference algorithms to predict demand patterns under volatile and uncertain conditions. These forecasts are linked to a dynamic inventory optimization engine, which computes ideal inventory levels, reorder points, and transfer strategies by considering service-level targets, holding costs, warehouse capacities, lead times, and stock variability. A distinctive feature of the system is its reinforcement learning-based feedback loop, which continuously updates model parameters based on actual performance outcomes such as forecast errors, stockout rates, and customer satisfaction scores, thereby ensuring continuous self-improvement. The invention also features a decision explainability module that provides transparent, user-friendly insights into forecasts and inventory recommendations, fostering greater trust in AI-assisted decision-making. Its modular design allows seamless integration with ERP, WMS, and SCM platforms and is scalable across industries including retail, manufacturing, e-commerce, and healthcare logistics. This invention enables organizations to shift from reactive, manual supply chain operations to proactive, data-driven, and resilient planning, transforming volatility into opportunity through intelligent automation and strategic foresight.

(57) Abstract :  
The present invention provides a novel and intelligent supplier evaluation and risk mitigation platform powered by Generative Artificial Intelligence (AI). The platform is designed to enhance the accuracy, depth, and responsiveness of supplier assessment in complex, dynamic supply chain environments. By aggregating and processing structured internal procurement data and unstructured external sources-, including regulatory filings, ESG disclosures, realtime news feeds, and social. media insights- the system constructs comprehensive and continuously up"dated supplier profiles. At the core of the invention is a generative risk simu-lation engine capable of forecasting supplier behavior and generating hypothetical. risk scenarios under diverse operational, geopolitical, and economic conditions. The platform enables procurement professionals to proactively identify vulnerabilities, evaluate alternate sourcing :>trategies, and implement mitigation -plans before actual disruptions occur. Advanced N LP, and machine learning techniques extract insights from non-traditional data sources, while the generative AI models simulate responses to supply chain stressors. The system incorporates a multi-criteria scoring mechanism that dynamically ranks suppliers based on factors such as strategic fit, compliance history, em·ironmental responsibility, financial stability, and adaptability. It features an intuitive, real-tim~ decision dashboard and a feedback-driven learning loop to improve accuracy and performa,1ce over time. By shifting from a static, backward-looking evaluation model to a predictive, generative, and adaptive framework, the invention significantly improves supplier governan~e, supply chain resilience, and strategic sourcing outcomes. This platform is scalable, cloud-cbmpatible, and suitable for deployment across manufacturing, retail, healthcare, and other indllStries with complex vendor ecosystems.

(57) Abstract :

ABSTRACT "Scan2Dine: An Automated Solution for Enforcing the One Plate Per Person Policy" Scan2Dine is an automated system designed to enforce the One Plate Per Person policy in institutional and corporate mess facilities. Using barcode-based authentication, the system verifies a person's eligibility before dispensing a plate, preventing unauthorized access. and reducing food wastage. It integrates an online payment gateway for day scholars and guests while maintaining a real-time plate count monitoring system that alerts staff when refills are needed. Additionally, a hosteller absence database, updated by the warden, prevents misuse of ID cards. With data analytics tracking consumption trends, Scan2Dine optimizes food preparation, ensuring efficiency, security, and fairness in mess management.

(57) Abstract :

Abstract We're a member of a growing internet-dependent innovation team. A significant increase in the number of people making purchases online has made nearly every area of life easier. The vast majority of individuals now conduct all of their business and personal affairs online. When it comes to processes, digital media processes follow a pattern. A rapid manner of billing machine is needed to avoid crowds and preserve social distance, and the suggested work is a Self-Billing Machines that can detect barcodes from items with the help of the buyer, generate bills. collect electronic payments using credit and debit cards, pack and seal the parcel, and distribute to a customer. We could implement an auto-spraying feature after each payment to keep the user experience region clean, much like a keyboard. Maximize effectiveness while minimising net maintenance costs.

(57) Abstract :

Abstract The growing environmental problems of landfills, such as limited space, pollution, and greenhouse gas emissions, necessitate new waste management methods. Machine learning (ML) represents a viable way to optimising resource allocation and reducing waste in 5 landfills. ML can anticipate waste composition, optimise landfill space, and improve waste segregation, resulting in increased recycling and composting activities. Furthermore, ML models may dynamically assign resources like labour, 'equipment, and landfill space based on real-time data, resulting in more efficient operations. Predictive models can also estimate landfill life cycles, allowing early interventions to increase landfill capacity while minimising 10 environmental damage. Additionally, ML algorithms can monitor pollutants such as methane, allowing for effective control and mitigation strategies. Significant reductions in trash volume and environmental harm can be realised by using ML into landfill management, hence promoting sustainable waste disposal practices. This method not only enhances operating efficiency but also helps to achieve global waste reduction and climate change 15 mitigation goals.

(57) Abstract :

Abstract Glass bottles play an essential part in everyday life since they are recyclable and perform well in hotels, malls, and bars, among other places. The creation of glass bottles, on the other hand, appears to be more complex, with a greater rate of manufacturing defects. To address this problem, FPGA spartan controller proposes an innovative solution. A gyroscope is utilized in 10 this approach and is installed in each bottle; if any of the bottles collide, the gyroscope pushes the bottle back to its original position using a DC motor. All the data is being sent to the cloud server, and in the future, we will be able to reduce the fault at any cost.

(57) Abstract :

Abstract Timely and precise wound monitoring is crucial for optimal healing and complication avoidance. Conventional methods often depend on visual examination and intermittent evaluation, which may be subjective and result in delayed reactions. A smart bandage solution is presented to tackle this difficulty, integrating Internet of Things (IoT) technology with ML for continuous and real-time wound evaluation. The intelligent bandage incorporates sensors that monitor essential wound parameters like temperature, moisture, pH, and exudate levels. Data gathered from the wound site is wirelessly communicated to a linked platform for analysis, facilitating the monitoring of healing process and the detection of infection or inflammation. The ML algorithm analyses sensor data to identify patterns linked to various healing phases, enabling early alarms and data-driven insights. An intuitive interface enables healthcare practitioners and carers to remotely get information and react promptly when intervention is required. This technique facilitates individualised treatment, minimises the need for recurrent hospital visits, and is especially advantageous in home or rural healthcare environments. The amalgamation of advanced sensors and intelligent analysis signifies progress in wound care and digital health solutions.

(57) Abstract :

Abstract In hotels, people sometimes have to wait for a waiter to take our food order. This causes issues at busy times in hotels, particularly during festival seasons and typically at weekends. The traditional restaurant meal ordering system is being replaced with IoT-based solutions. Restaurants are increasingly adding touch screen displays on tables in place of paper menu cards so that guests can 10 simply place orders for food by selecting the items directly from the screen. Our project's primary goals are to prevent these issues and provide solutions for them. Each table in this project will have a touch screen panel. Customers will choose the preferred order menus from the touch screen whenever they arrive at their table. Here, the order is placed using a TFT touch screen, and the data is sent to the controller using an RF module. All the data is uploaded to the cloud server, which serves as an IoT 15 platform that can be accessed from any location in the world.

(57) Abstract :

Abstract Temperature changes have a substantial impact on the performance and longevity of electric vehicle (EV) batteries, requiring the use of effective thermal management systems. It describes an 5 AI-powered dynamic temperature management system that optimizes battery temperature in real time. The system uses powerful machine learning algorithms to predict thermal behaviour under different operating situations and changes cooling or heating mechanisms appropriately. By including IoT sensors for continuous monitoring of battery temperature, voltage, and current, the AI model dynamically regulates the thermal environment, assuring optimum battery health and 10 efficiency. The method improves EV performance, lowers energy consumption, and increases battery life by solving major issues in EV battery temperature management.

(57) Abstract :

Abstract An autonomous IoT fleet management solution improves logistics operations by combining real-time monitoring, intelligent route planning, and predictive analytics. The system collects essential data from cars using integrated IoT sensors, GPS tracking, and on board diagnostics, such as position, speed, fuel levels, engine health, and cargo conditions. This data is handled on cloud platforms and edge computing to enable dynamic decision-making and autonomous reactions. Artificial intelligence systems provide adaptive route optimisation, early identification of mechanical faults, and automated scheduling, resulting in considerable reductions in delivery delays and operating expenses. The device also tracks driver behaviour to promote safety and maintain regulatory compliance. Enhanced communication modules guarantee that data is sent seamlessly between vehicles and control centres. The technology helps to make fleet operations more environmentally friendly and sustainable by lowering fuel usage and idle time. This holistic solution boosts overall efficiency, decreases human intervention, and offers real-time insight into fleet performance, making it appropriate for contemporary logistics and supply chain networks.

(57) Abstract :

Abstract The AI-Driven charging station for electric wheelchairs presents an advanced method aimed at enhancing the charging efficiency for electric wheelchairs. This system enhances charging efficiency, prolongs battery lifespan, and minimises energy consumption via the integration of adaptive power supply technology with AI-driven demand forecasts. The adaptive power supply modifies the charging output according to the wheelchair's battery status, use trends, and ambient factors. Simultaneously, the use forecasting system anticipates the wheelchair's charging requirements by examining prior usage data, including daily mobility demands and distances covered. This allows the system to prioritise charging cycles, guaranteeing the 10 wheelchair is consistently prepared for usage while reducing superfluous energy use. The AI element persistently assimilates user behaviour, enhancing its forecasts and optimisation methodologies. This unique device offers tailored charging alternatives for wheelchair users while promoting energy conservation and environmental sustainability. The AI-Based charging station improves user experience by providing dependable and efficient charging for 15 electric wheelchair users.

(57) Abstract :

ABSTRACT An IoT-enabled interactive smart notice board system for educational institutions integrates digital communication, biometric attendance, and device control functionalities into a unified platform. The system comprises a dynamic display module driven by a microcontroller (Raspberry Pi) that renders real-time notices based on role-based access using RFID and NFC technologies. A biometric verification module employing fingerprint and facial recognition enables secure, automated attendance logging. The system further includes a voice interface utilizing speech recognition and text-to-speech conversion to enhance accessibility, particularly for visually impaired users. Communication with IoT devices such as lights, projectors, and environmental sensors is facilitated through MQTT and Node-RED protocols, allowing centralized device management and event-triggered automation. A web-based content management system enables administrators to remotely publish and prioritize notices, including emergency alerts, academic updates, and user-specific announcements. The architecture features a multi-layered design comprising presentation, application, data, and edge layers to ensure modularity, scalability, and low-latency performance. The system encrypts all biometric and user data in compliance with privacy standards and supports offline functionality during network outages. Real-time updates are distributed via a priority-based notice scheduling engine with confirmation and acknowledgment tracking. The hardware is enclosed in a dual-purpose mirror-display chassis allowing unobtrusive integration into institutional environments. The invention significantly reduces administrative workload, eliminates paper-based processes, and enhances real-time communication, offering a sustainable and scalable smart campus solution compatible with future upgrades such as AI-driven analytics, mobile access, and expanded sensor integration.

(57) Abstract :

Abstract The presert invention discloses a comprehensive, AI-driven system and method for automating the classification, weight estimation, and dynamic pricing of fresh produce, with a primary focus on vegetables. The system integrates advanced computer vision models, IoT-enabled hardware, and intelligent pricing algorithms to enhance the efficiency, accuracy, and transparency of fresh produce handling in retail and agricultural markets. At the core of the invention is a YOLOv8-based deep learning model trained to perform real-time classification and defect detection of 'vegetables using image data captured from embedded camera modules. The classified produce is further segmented by size using unsupervised clustering techniques such as DBSCAN and K-Means. For physical quantification, the system employs precision load cell sensors connected to microcontrollers (e.g., ESP32 or Raspberry Pi) to estimate the weight of each item, which is crucial for price calculation. The pricing mechanism is driven by a Kernel Density Estimation (KDE) approach applied to historical and real-time market data, enabling adaptive, demand-responsive pricing. Cloud-based A Pis, such as Google Market A Pis, are integrated to fetch current pricing trends, ensuring that price recommendations reflect real-world conditions. A cloud synchronization framework supports real-time transaction handling, automated billing, data storage, and visualization dashbvards for users. This invention addresses inefficiencies in traditional produce retailing, reducing manual errors, labor dependency, and price manipulati.on. It benefits retailers, tarmers, and supply chain operators by providing an end-to-end intelligent system for real-time produce evaluation and pricing. The system's modularity allows for scalability across various retail formats and agricultural ecosystems.

(57) Abstract :

According to the present disclosure, a system (100) for in-situ continuous monitoring of distributed temperature of a molten metal inside a melting furnace is disclosed. The system (100) comprises a sensor mounting clamp unit (10) fitted at an end of the melting furnace (200) and a waveguide sensor unit (20) fitted to the sensor mounting clamp unit (10). The sensor mounting clamp unit (10) comprises an external slider unit (16) holding a horizontal support pipe (12) outside the vessel unit and supports the waveguide sensor unit (20) mechanism for precise sensor adjustments. A depth adjuster (18) is attached to the horizontal support pipe (12) via a top mount at a height, allowing the waveguide to slide and mount at different heights. The present invention provides a real time continuous measurement values helping industries to make critical decisions and control damage.

(57) Abstract :

Disclosed is a profile rectification system (100) for a pipe conveyor (202) includes a rotation assembly (102) that rotates selectively in a clockwise or counterclockwise direction, featuring a plurality of teeth (108) along its outer periphery (104). A series of clamps (110A-N), connected to the inner periphery (106) of the rotation assembly (102), house bushes (112A-N) that interface with the pipe conveyor (202) to generate friction. Springs (114A-N) coupled to each bush (112A-N) maintain controlled tension, ensuring consistent frictional engagement with the conveyor. A drive mechanism (116), comprising motor-driven gears (118), imparts rotational motion to the rotation assembly (102). The interaction of the clamps, bushes, springs, and conveyor facilitates profile rectification, providing adjustable and efficient movement for improved operation. The present disclosure also relates to a method (400) for rectifying the profile of a pipe conveyor using a profile rectification system (100). Figure 1A will be the reference.

(57) Abstract :

Disclosed is a brush system (100) for cleaning an internal surface of a wagon (102) includes one or more articulated arms (104A–C) configured for precise three-dimensional positioning of an end effector (110). The end effector (110) comprises a rotating element (112) and one or more flexible chain elements (114A–N) mounted on its periphery. Upon bidirectional rotation of the rotating element (112), the chain elements (114A–N) undergo centrifugal expansion to generate impact forces that dislodge adhered particles. The system further integrates position sensors (106) for capturing real-time spatial data of the wagon (102) and a processor (108) for analyzing this data, controlling the movement of the articulated arms (104A–C), and adjusting the end effector (110) to optimize cleaning. The present disclosure further relates to a method (200) for cleaning the wagon (102) by way of the system (100). Figure 1A will be the reference.

(57) Abstract :  
ABSTRACT: A leading cause of vision impairment worldwide is diagnosed as Diabetic retinopathy (DR). Accurate and early detection is necessary to prevent irreversible blindness. The study presents an automated DR detection and classification system that leverages deep learning techniques applied to retinal fundus images. The EMDRNET system integrates a transformer backend architecture, pretrained for medical applications, with a multi-level convolutional neural network to harness complementary feature extraction capabilities. The model was trained on a publicly available, multi-class dataset representing the five standard DR stages and incorporates image preprocessing and augmentation to enhance robustness against variations in illumination, resolution, and noise. Performance metrics, including classification loss, Recall, F !-Score, Precision and Accuracy, demonstrating effective discrimination across severity levels of DR. The system supports real-time inference and optimized for deployment in diverse clinical, mobile, and remote healthcare environments, facilitating scalable and cost-effective DR screening. Additionally, it incorporates Grad-CAM method, an explainable AI approach, which provide visual interpretability by highlighting the retinal regions that influence the model's decisions. This aids in clinical validation .

(57) Abstract :

Abstract The present invention relates to an autonomous, AI-driven college hall reservation system designed to streamline the booking of institutional resources such as classrooms, seminar halls, and laboratories. Integrating advanced chatbot technology, the system leverages natural language processing (NLP), real-time scheduling algorithms, and Internet of Things (IoT) sensors for occupancy detection. The system enables users (students, faculty, and staff) to interact via a conversational chatbot interface for seam less reservation, cancellation, and status inquiries. The AI engine processes user requests, checks real-time availability, resolves scheduling conflicts, and provides instant «...unlirmatiuns ur alternative suggestions. IoT sensors monitor actual hall usage and update the system to prevent double-booking and optimize resource utilization. Notifications and alerts are sent to users via SMS, email, or app notifications in case of schedule changes or conflicts. The fully integrated design minimizes administrative workload, reduces human error, and ensures efficient, transparent, and user-friendly management of college facilities.

(57) Abstract :

ABSTRACT 5 Embodiments disclose a utility model is related to a system that can provide complete bio-degradable formulation and solution for replacing the current Poly ethylene (PE) based films. The agar based films are prepared by de ligninated, cellulose nanofibers from two recyclable materials (Palmyra sprout peel and onion skin), treated with plasticizers and additives in order to derive the end-use specified 10 applicability. The invention includes complete use of surface un-treated, surface treated, and other degradable material as a base towards the process of obtaining an initial polymeric film with controlled coating parameters of supramolecular structures. This combinatorial approach offers technically a feasible process able to obtain a film with complete biodegradability. The novel approach in developing 15 the agar-based cellulose Bio-Nano composite Film coated material, where the formulation of film is completely based on Palmyra sprout peel and onion skin.

(57) Abstract :

The ReVolt Rebuilder is a smart battery maintenance and equalization system designed to monitor, refresh, and extend the lifespan of rechargeable battery packs. Unlike standard Battery Management Systems (BMS), this project focuses on individual cell health by continuously measuring voltages, balancing overcharged cells using passive resistive discharge, and gently recharging weak or underperforming cells. The system utilizes an Arduino Uno for real-time control, data logging in EEPROM, and visual feedback through a display or serial interface. Optional temperature sensing and load testing enhance safety and help in early detection of deteriorating cells. This cost-effective solution is applicable in electric vehicles, renewable energy storage, UPS systems, and other battery-powered devices. By maintaining balance and identifying faulty cells early, the ReVolt Rebuilder increases battery efficiency, reliability, and safety while reducing maintenance costs.

(57) Abstract :

ABSTRACT The construction industry heavily relies on cement, which is not only costly and resource-intensive but also contributes significantly to CO<sub>2</sub> emissions. The experiments were designed to study the effects of adding Cow Dung Powder (COP) in various percentages by weight (10%, 13%, 16% and 20%) of cement and cure for the periods of 1, 14, and 28 days respectively before testing for the Compressive strengths. It also involves determination of setting time, Bulk Density, and Workability of Cow Dung Powder in various percentages by mixing with Portland cement. The Compressive test results are 22.00 N/mm<sup>2</sup>, 20.22 N/mm<sup>2</sup>, 19.55 N/mm<sup>2</sup>, 13.78 N/mm<sup>2</sup> and 12.13 N/mm<sup>2</sup> for 0%, 10%, 13%, 16% and 20% replacement of cement with COP respectively at 28 days. The Workability results gives 112mm, 127mm, 130mm, 72mm and 80mm respectively for 0%, 10%, 13%, 16% and 20% replacement of cement with COP. Test results indicated that the consistency limits increased up to an optimum content and decreased further with the increase in the % of COP in cement. COP has an advantage that offers lightness of weight and low thermal conductivity, Cow Dung Powder concrete is recommended for use only when a thirteen percentage (10%) of Cow Dung Powder is added. The increasing demand for sustainable and eco-friendly construction materials has led to the exploration of alternative binders and cementitious materials. This study investigates the feasibility of using cow dung powder as a partial replacement for cement in concrete production. Cow dung, a natural waste product rich in organic and fibrous content, is processed into a fine powder and incorporated into cement at varying replacement levels (e.g., 5%, 10%, 15%, and 20%). The mechanical properties of the modified concrete, including compressive strength, workability, and setting time, are analysed and compared with conventional concrete.

(57) Abstract :

6. Abstract of the invention: Title: Ultrasonic-Assisted Catalytic System Using Textile Waste-Derived Char for Simultaneous Water Purification and Carbon Dioxide Conversion The invention relates to an ultrasonic-assisted catalytic system utilizing char derived from textile micro-waste for simultaneous water purification and carbon dioxide (CO<sub>2</sub>) conversion. The system comprises a modular reactor integrated with fluid and gas inflow controllers, an ultrasonic wave generator; and catalytic coated removable substrates. The char is synthesized from textile waste via pyrolysis in a nitrogen or ammonia-rich atmosphere and is functionalized for enhanced catalytic performance. Ultrasonic energy (20-40 kHz) is applied to induce cavitation, promoting the degradation of organic pollutants in water and facilitating the catalytic reduction of CO<sub>2</sub> into value-added gases such as methane. The system includes monitoring units such as flow meters, pH/DO sensors, and NDIR sensors. The design enables concurrent treatment of gaseous and aqueous streams within a compact chamber, supporting sustainable waste management and circular economy principles. The invention offers a scalable, energy-efficient solution for environmental remediation and integrated pollution control using textile industry waste.

(57) Abstract :

Abstract Lake Guardian: Autonomous Robotic Boats for Debris Cleanup and Pollution Prevention - The growing concentration of floating debris and Water pollution in freshwater habitats is a critical environmental issue to both aquatic organisms and human health. Lake Guardian is an autonomous robotic boat system to scout, avoid pollution and recover debris, as it is applicable to this issue. The Lake Guardian system utilizes an ESP32 microcontroller [7] as its component and employs GPS[IO] and GSM[II] models of the microcontroller-specific to get an accurate location and serve for remote communication processing as requirement needed while programming. The system has a pre-scheduled outdoor platform, and ultrasound sensors to detect obstruction and uses an ESP32 camera module[14] for necessary object detection and recognition. The whole system uses object classification methods and image pre-processing methods to detect waste material and classify it. The drive board provides control of the DC motors[9,13] for both navigating and the collection mechanisms on-board. The system proposal has an optimal scan setting for best area coverage in its movement. It uses an LCD interface[S], to show real-time updates on the system and detected object. The compact and energy-efficient system is powered 50% via solar energy, and can operate remotely, which reduces operational cost and offers a baseline for smart environmental cleanup alternative. Lake Guardian has promised its design and operation that automates processes with vision systems it can assist in the sustainability of water management.

(57) Abstract :

Quantum Dot Cellular Automata (QCA) is a future technology for nanometer scale computing. QCA technology is extremely important for switching speeds with high density and very low power consumption of devices. In this article, the circuit is verified using knickenergy calculations. We designed the binary to gray converter with four Inputs. The function between different QCA structures operates at very low temperatures with a metal dot structure about 1 kelvin, whereas here the operating range of temperature increased up to 9.4 K. A reduction in the distance between two consecutive cells in the metal point-QCA to 1 nm gives an output shaft better than the standarci cell distance of 2 nm. In QCA, the distance between the output cell and the cell decreases between cells and between cells, and the increase in knot energy improves instability.

(57) Abstract :

The tollgate bay (1) includes width entrance (2) where the distance sensor (dual) (4) are planted for evaluating the width of vehicles such as oversized structure or widened io body type. The widening systems includes a barrier walls (3) with supporting pole (6) and traction wheels (8) that are engaged in every guiding rails (5) provided in the bay and they are powered by drive motor (7) integrated separately for every barriers. Each barriers are connected with one another using barrier interlinks (9). The processing system includes a microcontroller interface (10) engaged with timer control (11) that 15 holds every barriers for few seconds upto the vehicles passes out completely. The sensor data inputs are processed into signals which is provided for motors to drive every barriers to slide over guiding rails (5) using wheels (8) facilitates opening or closing of barrier walls (3) whenever vehicle passes through the system, improves quick passing and minimizes delay or waiting time in tollgate lanes.

(57) Abstract :

The invention relates to a universal-sized silicon glove system comprising a silicon glove body (4), palm insert (1), finger inserts (2), and a wrist sleeve (3). The glove body (4) includes internal slots to accommodate the palm insert (1) and finger inserts (2), allowing adjustment to various hand shapes and sizes. The palm insert (1) provides additional support and grip in the palm area. Finger inserts (2) enable finetuned fit and comfort within each finger compartment. The wrist sleeve (3) features an adjustable fastening mechanism to secure the glove on wrists of different sizes. All components are reusable and made of washable silicon. The glove offers a customizable fit, improved control, and reusability for multiple environments.

(57) Abstract :

The invention relates to a digital liquid volume measuring funnel that allows accurate measurement during pouring. It includes a funnel (1) with a liquid pour inlet (2), leading to a stem (3) and a liquid outlet (4). A flow sensor (5) is installed within the stem (3) to detect the volume of liquid passing through. The sensor data is processed by a micro controller interface (6) located inside the funnel body. An LCD display (7) mounted externally shows real-time volume measurements. The device is powered by a battery (8) integrated within the funnel. This design enables simultaneous pouring and measuring of liquids without additional tools.

(57) Abstract :

invention discloses a remotely configurable robotic pathway markers for traffic and pedestrian control regulation in large spaces. Each robotic chassis (1) includes a traction wheels (2) for mobility, solar panel (3), LED path way lights (4), distance sensors (8) and a microcontroller interface (5). The WiFi communication io modules includes a Wi-Fi transceiver (6) for robot chassis (1), a Wi-Fi transceiver (7) for control unit (10) and a Wi-Fi antenna (9) integrated in each robot chassis for enhanced signal strength for seamless communications. The robots can move and position themselves based on commands sent from the master control unit (10). They automatically arrange into formations to create temporary paths, barriers, or 15 boundaries without the need for manual setup. The system allows remote monitoring and quick reconfiguration, making it suitable for use in warehouse arena or industrial sites. This system reduces the need for labour, increases flexibility, and improves safety through better visibility and automation.

(57) Abstract :

This invention relates to a smart hat for the visually challenged. This invention typically includes a tp4056 (1), a hat (2),an ultrasonic sensor (3), an arduino uno (4),a switch (5),a buzzer (6), and a battery (7). This invention is for the visually challenged significantly enhances user safety and independence by providing hands-free, realtime obstacle detection and intuitive audio alerts, all within a comfortable, affordable, and easy-to-use design. This invention has diverse applications, including enhancing safe navigation for the visually impaired, aiding in social distancing efforts, improving industrial worker safety, and serving as a tool in various training scenarios.

(57) Abstract :

The invention discloses a smart recycling system for converting construction and 5 demolition waste into construction bricks. The system includes a Demolition Waste Collection Unit (1) for receiving debris, followed by a Primary Crushing Unit (2) and Secondary Crushing Unit (3) for size reduction. A Vibrating Sieve Separator (4) filters fine particles, which are then cleaned in a Washing Tank (5). The slurry is processed through a Filtration System (6) to recover reusable materials and water. Cleaned 10 particles are dried in a Drying Chamber (7) and stored in a Recycled Sand Storage Bin (8). The material is then molded into bricks using a Brick Moulding Machine (9). The entire operation is controlled by a Municipal Control and Monitoring Unit (10) integrated with the city's building approval system.

(57) Abstract :

This invention relates to an eco-friendly blackboard chalk using egg shells. This invention typically an eggshell powder (1), a plaster of paris (2), a natural binders (3), a water (4), and additives (5). This invention offers advantages by significantly reducing environmental impact from limestone mining and landfill waste, while providing a healthier, low-dust, and biodegradable writing solution. This invention is primarily applied as a sustainable, low-dust, and non-toxic writing tool for blackboards in educational settings, with potential extended uses in art, industrial marking, and outdoor recreational activities.

(57) Abstract :

The invention relates to a compact AI-powered voice assistive device for mute 5 individuals, comprising a touchscreen display unit (1) for multilingual text input and a microcontroller with AI processing module (2) to handle predictive typing and system functions. The text-to-speech conversion module (4) transforms the text into natural voice output, while the emotion detection and voice modulation unit (5) adjusts the speech tone based on user intent. The internal speaker (6) delivers the output, 10 powered by a rechargeable battery unit (7). Stored language and voice data are maintained in the storage memory (8). The offline language processing system (9) ensures full functionality without internet connectivity. The entire system is housed in a portable protective casing (10), offering speech-impaired users real-time verbal communication in their native language.

(57) Abstract :  
The invention relates to a vacuum cleaning attachment (1) designed for efficient cleaning of ceiling fan blades. It features a hollow, rectangular tubular enclosure (1) with internal soft brushes (4) that contact both sides of the blade simultaneously. A flexible connecting tube (3) links the enclosure to a compact 12V air pump motor (2) that creates suction to draw dust into a dust collection chamber (5). The device includes an adjustable extension handle (6) for safe, ladder-free operation. The attachment is lightweight, reusable, and 3D-printed for custom fit. This system minimizes dust exposure and physical effort during cleaning. It can also be adapted for other elevated horizontal surfaces.

(57) Abstract :

The invention discloses an automatic natural flower arrangement machine integrated 5 with a mobile application interface (1) for design selection or upload. The system receives floral design patterns via a wireless communication module (8) and processes them through a central control unit (2) using a design pattern recognition system (7). A flower storage module (3), equipped with a freshness preservation unit (9), holds assorted real flowers. A robotic arm with picker mechanism (4) gently selects 10 and places flowers onto the arrangement platform (5) with precision. The platform supports accurate alignment and movement for design replication. A binding and securing module (6) fixes the flowers using thread, wire, or adhesive. The machine operates without manual effort, enabling consistent, customizable floral arrangements using natural flowers.

(57) Abstract :

This present invention discloses a "Smart Dual Pole Laser Barrier System with IoT Enabled Alert and Warning Mechanism for Child Safety" ensures child's safety and enhances the working efficiency of the barrier system through various alert mechanisms implemented. The barrier system is comprised with a dual poles (1) made with material which provides stability when placed anywhere in the living area. One 10 pole is embedded with the laser light sensor (2) which projects thin, invisible laser beam towards the laser receiver sensor (3) located in the opposite pole to maintain proper alignment of laser beam, creating an invisible fencing barrier which detects interruption of a child when they breaches the boundaries that are hazard. A pair of beacon light (4) are mounted on each pole which flashes red light by alerting people 15 nearby when a child crossed the barrier system. A detachable guiding track (5) facilitates movement of a shuttle car (6) which can be inserted with the track via hollow pipe mounted with bottom section of it to avoid picking up of the car by a child. This car (6) enabled with a motorized system, moves along the track without any deviation, which helps in distracting the child from breaching the barrier system. To alert the 20 . people around the living area when their child interrupts the system, a cloud based interface is implemented which is a IoT interface (7) sends immediate warning alerts through SMS, Email or calls to their remote. devices like smartphones connected with the interface, ensures immediate action and response in protecting the child from hazardous situations. This IoT works in conjunction with laser receiver sensor (3) 25 enhancing automation and real time monitoring. A battery interface (8) provided as a power management system which supplies necessary power to the shuttle car (6) as well as IoT interface (7) for continuous functioning of the barrier system. Both interfaces are integrated within the shuttle car (6) to avoid damages of any kind

(57) Abstract :

The invention relates to a tablet expiry date informer apparatus comprising an 5 enclosure (1) containing storage shelves (2) that hold multiple dosette boxes (3). Each dosette box (3) includes tablet holders (4) covered with lids (5) for secure storage. A container identity mark (6) is affixed to each dosette box or holder to store expiry information. A scanner camera (7) reads these identity marks to extract and store expiry data. An IoT interface (8) is connected to transmit alerts to external devices I O when expiry dates approach or pass. A control interface (9) allows users to configure settings and view tablet status. The system ensures safe medicine consumption by automating expiry tracking and notifications

(57) Abstract :

The titled invention discloses a hybrid water tap system for residential, industrial, and agricultural settings to be operated both manually and remotely. Water enters the tap through the water tap inlet (1) and exits through the spout (2). The butterfly valve (11) 10 . regulates water flow by rotating a disc between closed and open position. The butterfly valve (11) is operated through the cartridge axle (5) that connects the manually operated tap handle (10) and the remotely operated servomotor (4). The servomotor (4) is triggered to rotate the butterfly valve (11) disc in clockwise. The tap handle (10) is turned to rotate the butterfly valve (11) disc in anti-clockwise direction. The cartridge 15 axle (5) is divided and equipped with upper part one-way gear (9) and lower part oneway gear (8) to ensure unidirectional rotation, preventing unintentional overriding of one mode over another.

(57) Abstract :

The titled invention discloses transportable dry mixing chamber for the mixing of cement mortar ingredients and the efficient collection of the mixed material. The system comprises a compact and transportable setup mounted on mobile chassis (1) 10 with wheels (2) and pulling handle (3), allowing it to be easily moved to various locations. The cement, sand, and other dry ingredients are mixed in the mixing chamber. drum (4). The rotating blade axle (6) driven by drive motor (7) is positioned centrally within the chamber and is equipped with two mixing blades (5) that rotate to ensure uniform blending of the contents. Spatula is mounted near the inner wall of the 15 mixing chamber drum (4) to scrape residual mortar from the drum walls. The mixed ingredients are discharged through the door (9) located on the front side of the chamber. The mixed ingredients from the mixing chamber drum (4) are directed through the drain channel (8) into the drain bucket (1 0). The controller (11) unit allows the user to operate and regulate the mixing process.

(57) Abstract :

The invention relates to a wheelchair (1) integrated with a therapeutic water circulation system (5) designed to prevent and heal pressure ulcers. It comprises a sitting pad (3) and back resting pad (4) embedded with water liners (5) through which temperaturecontrolled water flows. A water tank (6) stores the water, which is heated using a warm water chamber (7) as required. A water circulating pump (8) drives the water through a discharge pipe line (9) into the liners (5) and returns it via a return pipe line (10). I/O Control settings (11) allow regulation of temperature and flow based on user needs. The system is compactly built into the wheelchair without affecting mobility. This design provides localized thermal therapy for patients who remain seated for long durations.

(57) Abstract :

This invention relates to a smart ir hub. This invention typically includes a microcontroller (1),an ir leds (2),an ir receiver (3),a dht11 sensor (4),a resistors (5),a 5 capacitors (6),an uln2003 vdr (7),a pcb board (8),a pia 3d-printed enclosure (9),a top plate (10),a main body (11),a bottom plate (12).a rechargeable Battery (13). This invention intelligently automates and controls I R-based appliances, enhancing comfort and energy efficiency through real-time environmental sensing and mobile control, all within a sustainable, cost-effective design. This applies to automating IR-controlled 10 devices like air conditioners, TVs, and media systems in homes and small commercial spaces, enhan.cing comfort and energy efficiency through intelligent environmental sensing and mobile control.

(57) Abstract :

This invention relates to a digital lock system for truck's fuel tank. This invention typically includes a microcontroller (1), a digital lock/servo motor mechanism (2), a keypad/number pad (3), a power supply (4), an alarm system (5), a tilt sensor (6), a tamper switch (7), a display screen (8), an outer box (9). This invention offers enhanced security, real-time theft prevention, and improved fleet management by 10 replacing vulnerable mechanical locks with a smart, password-protected electronic system featuring instant alarms and remote monitoring capabilities. This invention is primarily applicable to commercial truck fleets, construction and mining vehicles, agricultural equipment, and military and government vehicles to prevent fuel theft and enhance security.

(57) Abstract :

This invention discloses an Aadhaar-powered smart voting system that automates 5 identity verification and vote casting using AI and biometric technologies. The voter inserts their Aadhaar card into the Aadhaar Card Reader (1) to verify age and identity. Facial recognition is performed through the Facial Recognition Camera (2), and fingerprint authentication is done via the Biometric Fingerprint Scanner (3), both processed by the AI-Based Authentication Module (5). Upon successful verification, I 0 the Touchscreen Voting Interface (4) displays a Multilingual User Interface (6) for selecting state, district, ward, and candidate. The vote is encrypted and stored in the Encrypted Vote Storage Unit (7), and simultaneously transmitted to a central database through the Central Server Connectivity Module (8) using the Network Communication Module (9). In the event of a system failure, the Emergency Data Backup System (1 0) 15 20 ensures vote preservation. This system ensures secure, instant, and tamper-resistant elections with minimal manpower.

(57) Abstract :

The invention provides an AI-powered voice-based examination system designed for 5 visually impaired candidates to take written exams independently without a human scribe. It uses an Optical Character Recognition module (1) to scan printed or digital question papers and a Text-to-Speech converter (2) to read the questions aloud through a Headphone Output (5). The candidate responds verbally using a Microphone Unit (4), and the Speech-to-Text engine (3) transcribes the spoken I O answers into text. The process is controlled via a User Interface Console (6) with tactile buttons. All responses are managed and processed by an Embedded Processor Board (7), then saved securely in a Storage Module (8). Upon completion, answers are printed using a Printer Interface (9). The entire system operates on a Rechargeable Power Bank Module (10), ensuring portability and uninterrupted 15 function during exams.

(57) Abstract :

The titled invention discloses a triple inflatable lumbar support chair for posture comfort with spinal alignment and muscle fatigue reduction. The sitting chair (1) includes user comfort features such as seat (2) with attachments of arm rest (3) on both sides of chair and back rest frame (4) to the rear of the seat base. The air inflation system 10 includes air inflation pump (9) integrated with the solenoid valve (10) for upper lumbar support pad (5), another solenoid valve (11) for middle lumbar support pad (6) and the solenoid valve (12) for lower lumbar support pad (7) connected with each other. These three sections of lumbar pads are designed with inflatable humps (8) in an organized structure which are housed into the back rest frame (4). The user control systems 15 includes pad selector control (13) for inflating the pads and pad selector control (14) for deflating the pads. Both are embedded in a single panel for ease of access by the user to adjust the pad inflation with controlled airflow, based on their desired region of lumbar support.

(57) Abstract :

This invention relates to a smart collaborative plucking cart that enhances tea harvesting. This invention typically includes a Mobile Platform/Chassis (1), a Perception and Sensing System (2), a Plucking Mechanism/Robotic Arm (3), a Collection System (4),a Control and Processing Unit (5),a Human-Machine Interface (HMI) I User Interface (6),a Power System (7), Safety Features (8). This invention 10 enhances tea harvesting by significantly increasing productivity, ensuring precise "two leaves and a bud" quality, reducing labour strain, and providing valuable data for optimized yield management. This invention can be applied in various tea estates globally to address labour shortages, improve tea quality and yield, and enhance the sustainability and efficiency of tea cultivation

(57) Abstract :

The titled invention discloses a laser beam guided barrier fencing bay for temporary car parking in large open spaces. This laser barrier device includes structural stability and support features such as base pedestal (1) and vertical pole (2) on it. The laser systems built over the vertical pole (2) includes a quadruple laser beam lens (3) embedded in a swiveling laser holder hub (4) which are controlled by using the laser 1 0 beam control switches (5) and the each laser beam's intensity and distance of laser passing along the parking bay can be adjusted using the beam length adjuster knobs (6) provided around each laser lens. The power supplying features for battery in battery housing (1 0) inside the vertical pole (2) includes a solar panel (8), charging power port (9) and the device activation/deactivation based on usage requirement can 15 be done using the power switch (7). This system of fencing prevents traffic congestion and ensures more space providing for vehicles to be parked over the bay in large open spaces.

(57) Abstract :

ABSTRACT The increasing demand for sustainable construction materials has driven the need for innovative alternatives to conventional concrete components. This study explores the partial replacement of cement with nano-silica and coarse aggregate with coconut shell to develop an eco-friendly and cost-effective concrete mix. Nano-silica, known for its high pozzolanic activity and fine particle size, improves the mechanical strength and durability of concrete. Coconut shells, an agricultural waste product, offer a lightweight and sustainable substitute for conventional coarse aggregates. The objective of this project is to analyse the workability, compressive strength, and durability characteristics of concrete containing varying percentages of nano-silica (e.g., 2%) and coconut shell (e.g., 10%). The results demonstrate the potential of this hybrid replacement technique to reduce environmental impact, minimize construction costs, and promote the use of renewable materials in civil engineering applications. This study explores the properties of concrete as a sustainable substitute for cement through the use of nano-silica in an eco-friendly aggregate system. Daily life generates a larger amount of coconut shell waste from the tropical zone. In India, the yearly deposition of coconut shell is about 80,000 tonnes, which is 6.7% of total agricultural waste. Crushing gravel production emits CO<sub>2</sub>, which is an environmental concern. Nano-silica in concrete improves the strength properties of concrete, which satisfies the various structural properties of concrete like compressive strength and tensile strength. It is expected that the final outcome of the project will have an overall beneficial effect on the utility of Nano-silica concrete in the field of civil engineering construction work.

(57) Abstract :  
Abstract The fast rise of electric vehicles (EVs) means that we need a strong, smart charging system that can handle power distribution well while keeping the grid stable. Charging patterns that aren't coordinated can lead to power imbalances, higher peak. loads, and not enough use of 5 renewable energy. This system creates a smart EV charging infrastructure that works perfectly with the power grid and uses artificial intelligence (AI) to make sure that energy flows in the best way possible. We use real-time data from EVs, the grid, and energy markets to predict demand and change charging schedules on the fly. The system can balance loads, lower peak demand, and lower energy costs thanks to AI methods like machine learning and 10 reinforcement learning. The infrastructure is also built to make it easier to use renewable energy and to use demand response strategies to make the grid more flexible. The results of the simulation show that energy efficiency has gone up a lot, grid stress has gone down, and the system is better aligned with the availability of low-cost, low-carbon energy. This smart charging framework not only makes charging easier for users, but it also helps build a 15 sustainable and strong energy ecosystem for future mobility.

(57) Abstract :

This invention relates to systems and methods for generating localized gravitational time dilation effects using a rapidly rotating high-density toroidal mass, suspended via advanced magnetic or superconducting techniques, within a controlled vacuum environment. It specifically pertains to a compact, terrestrial system and methods for apparatus designed to produce measurable spacetime curvature through rotational frame-dragging phenomena. A compact gravitational anchor system employs a high-density toroidal mass, rotated at > 100,000 RPM within a vacuum via superconducting or feedback system optimizes spacetime curvature, measured by spatially arranged atomic clocks detecting localized time dilation from frame-dragging effects. This tunable, terrestrial proposed methodologies of apparatus will enable applications in precision timing, quantum research, and time-buffered data storage.

(57) Abstract :

English is undoubtedly an international language today. Due to its global presence, it has become more important today than ever before. Students need English speaking in professional life and education. Several methods are observed in teaching of English to Indian students of different ages, social backgrounds, cultures, and learners of different needs. Until 1970's, Grammar Translation method was employed by teaching linguistic structures and linguistic forms which aimed at improving grammatical competence by memorizing rules to understand the syntax of L2. But it neglects the role of language functions and socio-cultural aspects. Learning linguistic competence like grammar, direct utterances hardly have any scope for hidden or implied meanings. But in everyday conversation speakers convey most of the communicational content by way of implication rather than by explicit statements. In fact it is not possible to have a conversation without the use of implicit meaning. So the pragmatic potential or contextually hidden meanings of utterances are to be taken into consideration. In other words, pragmatics are contextually because every utterance is not alone, the intention and the way it was uttered has socio-cultural inference. Speech acts such as requesting, greeting, inviting and apologizing are included in communicative actions like conversation, discussion and different types of discourses. This paper focuses on self-learning of the students by enriching their pragmatic linguistics.

(57) Abstract :

The current invention A subsystem named XccelerateDL and its methods allow for quicker internet content downloads (text with multimedia items). XccelerateDL optimizes download manager speed using machine learning and artificial intelligence\_(AI/ML)-techniques.-Its-----uniqueness is further increased by features like quantum-resistant encryption, decentralized storage integration, and blockchain verification. With considerable technological knowledge and ingenuity, the integration of AI/ML with download management has been accomplished with success, particularly for predictive speed optimization. When P2P networks, hybrid cloud-local -Cll models, and sophisticated privacy features are combined, an obscure solution that surpasses the C) Ill state of the art is revealed. D.. Cll The current idea has obvious industrial applications in a number of fields, including enterprises, -1- organizations, and individual users. it is useful in sectors including media, software development, -N and content distribution because of its capacity to optimize down loads for speed, dependability, and privacy. As a result, XccelerateDL fills important gaps in the current download manager technology (from internet) with its unique and non-obvious characteristics, as detailed in its technical explanation. It satisfies the utility criteria for patentability due to its industrial usefulness also

(57) Abstract :

This invention synthesised the skin protective antidandruff natural hair dye using ultrasound from Lawsonia inermis and Indigofera tinctoria with minor ingredients such as raw green tea, triphala, black cumin, aloe vera, and hibiscus.

(57) Abstract :

The invention discloses a Nebulizer Device with Integrated UV-C Light Mask Disinfection that combines medication delivery and automated hygiene. It includes a nebulizer unit (1) connected to a mask body (2) for administering aerosolized medication. After use, the mask (2) is placed in a designated mask storage compartment (4) containing a UV-C light module (3). A microcontroller (5) activates the 10 UV-C light for disinfection, with exposure duration managed by a timer circuit (6). A safety sensor (7) ensures the compartment is closed before activation. User interaction is enabled through control buttons (8) and feedback via a display screen -A power-supply-unit (-10)-supports AC-or-battery operation,-making-the-system suitable for various settings

(57) Abstract :  
"RoadBot: An Agentic AI and Edge-IoT Based Road Surveillance and Pothole Scoring System Using Connected Vehicles" presents an innovative approach to road safety and maintenance. This system leverages the Sharp GP2YOA02YKOF infrared sensor and the SparkFun AOXL345 accelerometer to detect road anomalies, specifically potholes. Sensor data is processed through an Arduino UNO ADC unit, which triggers two key actions upon detecting a pothole: the vehicle's speed is reduced, and GPS coordinates are recorded. Over the course of a trip, the frequency of pothole encounters is analyzed by an Agentic AI, which assigns a road quality score. This scoring mechanism aids in proactive road maintenance and enhances overall driving safety by providing real-time feedback and data-driven insights

(57) Abstract :

Vehicle accidents that take place due to the insufficient awareness of the driver about the surrounding vehicles are very wide-spread events in a country like India where the road traffic is so congested and the roads themselves are not in proper condition. In this kind of a situation, the accidents that take place due to the vehicles in a blind spot to the driver of another vehicle is increasing as time goes along. Also, the current systems available for Blind Spot Warning are significantly expensive. We propose a low-cost, effective Warning System to alert the drivers about other moving vehicles in their surroundings which they, naturally, are not able to see on their own while driving. We, therefore, use USB Camera sensors and a LiDAR sensor to get the images and to derive the physical parameters of the surrounding vehicles from an ego vehicle. These parameters and images are then processed using a Broadcom microprocessor placed on the Raspberry Pi V4 board. The novelty of the work is to acquire the parameters using the Broadcom Microprocessor, placed in Raspberry Pi 4 Model B board, LiDAR and Camera sensors. The driver is alerted according to the results that are produced from the code written for the USB Camera sensor and the LiDAR improves the probability of producing more reliable output and thereby the conclusions drawn from this system becomes more accurate and efficient.

(57) Abstract :

This invention synthesised, 1 H-pyrrol-2-yl)piperidine characterized the 1-(1-methyl-3, 4, 5-tri(piperidin-1-yl)and 1-(1-methyl-3,4,5-tri(piperidin-1-yl)-1 H-pyrrol-2-yl)piperidine for the antibacterial inhibition and all kinds of biological activities. The compounds of pyrrole were prepared by using iodinated pyrrole with piperidine and morpholine. The derived compounds showed good result against the bacterial strains and cancer cell lines.

(57) Abstract :

To design a Double H-Slot Microstrip Antenna for diathermy treatment, ensuring efficient electromagnetic wave penetration and controlled heating of biological tissues. The antenna operates at I GHz, optimizing energy transfer for hyperthermia applications. The antenna structure incorporates vertical and ~orizontal slot cuts, forming a double H-slot configuration with equal spacing between slots, ensuring uniform current distribution and improved resonance characteristics. This enhances impedance matching, bandwidth, and radiation efficiency, minimizing power loss and ensuring precise thermal distribution. The design is compact, lightweight, and adaptable, making it suitable for wearable medical devices and biomedical imaging applications. It integrates easily with RF medical equipment, supporting multi-band operation and tunability for various medical treatments. The optimized feeding lnetwork ensures stable power delivery, improving efficiency and patient safety

(57) Abstract :

The proposed Optimized Deep Neural Computing (ODNC) model enhances seizure detection accuracy by combining the Whale Optimization Algorithm and Deep Bayesian Neural Networks. Trained on the CHB-MIT dataset, the model leverages Discrete Wavelet Transform (DWT) for feature extraction, removing noise and artifacts. Whale Optimization fine-tunes neural network weights for optimal learning, while the Bayesian layer estimates prediction uncertainty, crucial for medical reliability. This system outperforms traditional methods by improving accuracy, precision, recall, and F1 score. By delivering continuous, accurate monitoring, the ODNC model represents a breakthrough in medical AI for epilepsy management, providing a robust and adaptable tool for detecting seizures and supporting better patient outcomes

(57) Abstract :

At Chennai, Kodungaiyur, the current study investigates the health effects of air pollution with specific reference to the common pollutants, i.e., carbon monoxide (CO), particulate matter (PM2.5), temperature, and humidity. The monitoring operations were carried out during the months of October and December (OND) with the assistance of a smart sensor system that utilized an Arduino UNO board and a display device. This observation technique provides required information on the post-monsoon period, which is characterized by increased variability in the atmosphere. Along with environmental observations, health interviews were conducted on traffic police officers who had been exposed to air pollution due to traffic for a long duration of time. Self-reported symptoms elicited included difficulty in breathing, headache, chronic coughing, eye irritation, and drowsiness; these symptoms are linked with well-documented adverse effects of air pollution. Similarly, as variability in pollution levels determines reported prevalence as well as symptom intensity, the current study is evident in linking environmental observations with health effects. Results identify areas that require strengthening under the guise of implementing stronger emissions controls, improving green cover, and employing eco-friendly vehicles. Moreover, the results provide evidence of the need to reduce pollution levels in high-exposure areas such as Kodungaiyur for protecting the health of the public. The current study encourages healthier, cleaner, and greener urban environments by solving the problem of air quality.

(57) Abstract :

ABSTRACT OF THE INVENTION The present invention relates to a high-speed, hard ware-efficient VLSI architecture for - adaptive-filtering-aimed-at-enhancing-electroencephalogram (EEG)\_signals. The proposed system incorporates multiple adaptive filtering algorithms, including the conventional Least Mean Squares (LMS), Delayed LMS, Pipelined LMS, and Unfolded LMS, each optimized using retiming techniques to improve convergence speed and reduce mean square error (MSE). The design is implemented at the register-transfer level (RTL), employing parallel processing and pipelining methodologies to support real-time signal enhancement with minimal latency. Simulation results validate the effectiveness of the proposed system in denoising EEG signals, confirming its suitability for integration into biomedical monitoring devices. The architecture is scalable, power-efficient, and adaptable to various signal environments, making it an ideal solution for portable EEG acquisition systems and wearable health monitoring platform

(57) Abstract :

This invention provides a fire prevention and risk mitigation system for air conditioners in clinical consultation rooms. It includes a temperature monitoring module (1) to detect 5 prolonged low-temperature operation, and door monitoring sensors (2) to record door activity affecting cooling efficiency. An operational timer (3) tracks continuous AC usage. Data from these modules is processed by a control logic unit (4) that identifies unsafe conditions. When risk is detected, an alarm and shut-off mechanism (5) activates to disconnect the AC and alert nearby staff. A power supply with battery io backup (6) ensures uninterrupted function. A wireless communication module (7) sends real-time alerts to maintenance personnel.

(57) Abstract :  
ABSTRACT OF THE INVENTION This invention presents a modified hybrid counter architecture that combines a Galois Linear Feedback Shift Register (LFSR) with a conventional binary counter to enhance performance and randomness. The proposed 64-bit design is optimized for high-speed and low-power applications using RTL-level modeling and advanced pipelining techniques. The hybrid approach improves pseudorandom number generation while maintaining accurate counting functionality. Simulation results confirm the correctness and robustness of the design. Power analysis reveals reduced consumption compared to traditional counters. The architecture is scalable, making it adaptable to various digital systems. Efficient hardware utilization is demonstrated through RTL and technology schematics. The system is ideal for applications in cryptography, embedded systems, and communication protocols. Overall, the invention provides a reliable, compact, and high-performance

(57) Abstract :

The invention relates to a machine learning-based system for counterfeit currency detection, designed to accurately classify currency notes as genuine or counterfeit through advanced image analysis. The system comprises an image acquisition module for capturing high-resolution images of banknotes, a preprocessing module for normalizing, resizing, and enhancing image quality, and a feature extraction module utilizing computer vision techniques to identify visual, structural, and texture-based characteristics. The core of the system incorporates deep learning models, specifically AlexNet and VGG16, trained on diverse datasets of authentic and counterfeit notes, enabling robust classification under varying conditions. The architecture enhances detection accuracy, improves generalization across currency types, and reduces false positives. A Django-based web interface facilitates real-time user interaction, image upload, and result display, making the system practical for deployment in financial institutions, retail sectors, and security checkpoints. The design is scalable, efficient, and adaptable, ensuring secure and reliable counterfeit detection across multiple currency formats and environments.

(57) Abstract :

The present invention- relates to-a-robust and-accurate machine learning-system-for-medical image- - classification, designed to defend against adversarial attacks. It introduces gradient-free trained sign activation neural networks optimized via stochastic coordinate descent, enhancing resilience by requiring high distortion to mislead classifiers. A dual-path residual convolutional neural network processes MRI tumor segmentation and pathology images in parallel, significantly improving classification accuracy. Additionally, an adaptive adversarial detection module is proposed, employing entropy-based smoothing to reconstruct perturbed inputs without modifying the base model. The integrated framework ensures high performance, transferability resistance, and practical applicability across diverse medical imaging tasks.

(57) Abstract :

The invention relates to a sensor-based fall prevention system for hospital patients. It includes two floor mats (1,2) placed on either side of the bed, each embedded with a pressure sensor (3) calibrated to detect human weight. When a patient steps onto either mat, the sensor activates a wireless transmitter module (4). This module sends a signal to an audible alarm unit (5) and a visual indicator unit (6) located at the nurse station or caregiver area. The alarm and indicator immediately alert staff for intervention. The system is powered by a rechargeable battery (7) enclosed within the mat. This setup enables early detection and reduces fall-related risks.

(57) Abstract :

Carbon, one of the most abundant and versatile elements, is pivotal in material science and nanotechnology due to its exceptional structural and functional adaptability. This study reports the first simultaneous photogenic synthesis of silver nanoparticles (AgNPs) and carbon nanospheres (CNS) using Coriandrum sativum extract on activated carbon as a green and sustainable platform for sucralose detection. The formation of the CNS@AgNPs hybrid material, facilitated by oleic acid present in the plant extract, was confirmed through comprehensive characterization techniques including scanning electron microscopy (SEM), transmission electron microscopy (TEM), X-ray diffraction (XRD), Raman spectroscopy, Brunauer-Emmett- Teller (BET) surface area analysis, gas chromatography-mass spectrometry (GC-MS), diffuse reflectance spectroscopy (DRS), and thermogravimetric analysis (TGA). The graphite electrode modified with Nafion and CNS@AgNPs (GE/Nafion/CNS@AgNPs) exhibited a distinct oxidation peak for sucralose at +0.7 V. Differential pulse voltammetry (DPV) demonstrated a linear detection range of 2-14 pM, with a detection limit (LOD) of 0.2 pM and a quantification limit (LOQ) of 0.62 pM (R2 = 0.998). This eco-friendly sensor design underscores the potential of sustainable nanomaterials for developing efficient, sensitive, and selective electrochemical platforms for detecting artificial sweeteners in real-world samples

(57) Abstract :

ABSTRACT The present invention discloses a purely mechanical door lock mechanism designed to address the issue of accidental lock-ins. The system includes an internal emergency release feature that allows users inside the room to unlock the door even if it has been inadvertently locked from the outside. This innovation is particularly useful in residential, commercial, and public environment's such as homes, theaters, malls, and changing rooms, where unintentional confinement poses a safety risk. The mechanism operates without the need for electricity or batteries, making it a reliable, low-maintenance, and cost-effective solution. By combining enhanced safety with mechanical simplicity, the invention offers a significant improvement over traditional locking systems.

## (57) Abstract :

A bi-directional smart tracking system comprising a central base unit and multiple remote tag units is disclosed, designed to facilitate the location of misplaced items and the central unit itself. The system operates on a low-power, direct wireless communication protocol that enables peer-to-peer signalling without the need for an active Wi-Fi infrastructure. The base unit includes multiple push buttons, each mapped to a specific tag unit. When a button is pressed, a wireless signal is transmitted to the corresponding tag, which activates audible and visual indicators to aid in locating the attached item. Each tag unit also features a reverse-locate function: upon activation, the tag sends a signal to the base unit, triggering its own alert mechanisms to help locate the base when misplaced. Both base and tag units are independently powered and equipped with rechargeable power sources and integrated charging modules to ensure safe and efficient recharging. To conserve energy, the processing components on both units enter a low-power state during inactivity. The system supports modular expansion and can be upgraded to include additional features such as user interfaces, mobile app connectivity, or signal-based directional assistance. This invention provides a compact, energy-efficient, and cost-effective solution for two-way item tracking, suitable for personal, commercial, and institutional use.

## (57) Abstract :

The present invention relates to a multifunctional toothbrush system that integrates a self-dispensing toothpaste mechanism, a replaceable brush head, and an internal storage compartment for essential oral hygiene tools. The toothbrush features a built-in reservoir and a user-operated actuator, such as a screw or press mechanism, that delivers a controlled amount of toothpaste directly to the bristles, eliminating the need for separate tubes and reducing mess. A removable brush head allows for easy replacement, enhancing hygiene and extending the device's lifespan. The base of the toothbrush incorporates a compact storage compartment configured to hold items such as a tongue cleaner, flosser, and an extra brush head, ensuring that all oral care essentials are readily accessible in a single unit. Designed for convenience, portability, and ease of use, this all-in-one toothbrush is particularly suitable for children, the elderly, individuals with limited mobility, and frequent travellers. The invention improves oral hygiene practices by simplifying the brushing process, promoting better accessibility, and minimizing waste through modular and refillable components.

(57) Abstract :

The present invention discloses a multifunctional travel accessory that combines the utility of an inflatable ergonomic headrest with the convenience and style of a personal 5 handbag. Constructed from lightweight, water-resistant TPU material, the invention serves dual purposes—when inflated, it functions as a contoured headrest that supports the neck and shoulders during travel or sedentary use; when deflated, it transforms into a compact, zippered handbag designed to carry daily essentials. The headrest's shape provides ergonomic support, while the handbag configuration offers sufficient internal 10 volume for personal items. This transformable design reduces the need to carry separate accessories, promoting convenience, comfort, and minimalism for travellers, --commuters,-and mobile-professionals. The,, invention is lightweight, durable, stylish, and suitable for both indoor and outdoor environments, offering a practical and aesthetic solution for on-the-go individuals.

(57) Abstract :

The present invention discloses ESP-NOW, an intelligent and modular vehicle communication and coordination system designed to enhance road safety, traffic efficiency, and vehicle-to-everything (V2X) connectivity. ESP-NOW integrates hardware and software components into a unified framework that facilitates real-time data acquisition, wireless communication, and centralized traffic management. The system features modular architecture comprising sensor integration units, low-latency communication protocols, real-time data analytics, and cloud-based control systems.

(57) Abstract :  
Abstract This invention discloses an intelligent, voice-activated elevator control system designed to enhance accessibility, user convenience, and operational efficiency through advanced speech recognition and user personalization technologies. The system incorporates high-sensitivity microphones, strategically positioned within the elevator cab and near floor call buttons, to ensure precise voice command capture. It employs state-of-the-art speech recognition algorithms capable of interpreting a wide range of voice inputs across various accents, dialects, and languages. Users can issue intuitive commands such as "Call elevator to floor 5" or "Go to floor 10," which are reliably executed in real time. To further optimize user interaction, the system allows the creation of individual user profiles, enabling recognition of frequent users and their preferences. Personalized settings can include commonly visited floors, frequently used commands, and specific user instructions. Feedback is provided through visual display screens showing recognized commands and system status, as well as audio confirmations for clarity and assurance. Error handling mechanisms prompt users for clarification when misinterpretations occur. Over time, integrated machine learning continuously enhances system performance by adapting to user behavior and improving command accuracy. This comprehensive solution offers a modern, user-centric approach to elevator operation, ideal for a wide demographic, including individuals with mobility or sensory challenges.

(57) Abstract :

ABSTRACT DUAL-BAND CIRCULARLY POLARIZED IMPLANTABLE ANTENNA: A METHOD AND DEVICE THEREOF A dual-band circularly polarized implantable antenna (100) for neuromuscular implant applications, operating at 915 MHz and 2450 MHz ISM bands, is disclosed. The antenna comprises a metallic patch (103), Rogers RT/Duroid 6010 LM substrate (104), and ground plane (113), exhibiting an ultra-miniaturized size of 0.0122/..o x 0.01225/..o x 0.00099/..o. The patch includes an outer tilted re-shaped slot (105) with a vertical slot (110) forming two resonators. An inner hook shaped T-slot (106) and asymmetrically placed L-shaped slots (107, 108), enables resonance and circular polarization at 915 MHz. A separate open-ended trapezoidal slot ( 1 09), mirrored Y-slot (111 ), and L-shaped slot (112) generate resonance and ~-----c-,ir:\_c\_u'la\_r\_p-o1arization-at-2450-MHz. The antenna exhibits 94 MHz and 166 MHz reflection coefficient bandwidths, 90 MHz and !54 MHz axial ratio bandwidths, and peak simulated-of-19.2 dBi and -18.7 dBi.

(57) Abstract :

ABSTRACT: Pancreatic cancer remains one of the most lethal forms of cancer due to its asymptomatic progression, limited treatment options, and poor prognosis. The invention, "AI-Based Early Diagnosis of Pancreatic Cancer," introduces an integrative, data-driven system that leverages advanced artificial intelligence techniques to enable timely detection and improved survival outcomes. This system unifies heterogeneous data sources, including clinical records and medical imaging, into a cohesive diagnostic framework powered by deep learning and ensemble machine learning methods. At the core of the architecture are convolutional neural networks and random forest classifiers, engineered to identify early-stage indicators of pancreatic malignancy with high precision. The system features a robust explainability layer through Explainable AI (XAI) techniques, enhancing clinical trust by providing interpretable insights into model decisions. Designed for seamless integration into clinical workflows, the system empowers healthcare professionals with accessible, intelligible diagnostic support. To ensure reliability and generalizability, the model undergoes rigorous performance evaluation across multiple validation metrics. This invention not only enables early detection but also fosters informed decision-making, setting a new standard in AI-assisted oncology diagnostics and offering significant potential to improve patient outcomes through early intervention.

(57) Abstract :

ANNEXURE -III The present invention relates to a sustainable concrete composition in which Ordinary Portland Cement (OPC) is partially replaced by industrial by-products-Fly Ash and Ground Granulated Blast Furnace Slag (GGBS)-to reduce cement consumption and environmental impact. The concrete is designed to achieve standard-grade performance, targeting M40-level compressive strength (approximately 40 MPa at 28 days), and is intended for general construction use without requiring specialized curing or placement techniques. To counteract the potential loss of workability due to cement replacement, a polycarboxylate ether (PCE)-based superplasticizer is incorporated at a controlled dosage (0.5-1.0% by weight of binder). This ensures the mix maintains adequate slump and flow characteristics suitable for conventional concrete casting and compaction methods. The optimal cement replacement level ranges between 20% and 30%, with typical combinations such as 15% Fly Ash and 15% GGBS. The water-to-binder ratio is maintained at 0.45 to balance strength and workability. The invention results in a concrete mix that is easy to prepare, place, and cure using standard practices, while also contributing to environmental sustainability through reduced OPC usage.

(57) Abstract :

Concrete is the most widely used construction material due to its strength, durability, and availability of raw materials. Fine aggregate, commonly sourced from river sand, is now in unsustainable demand due to rapid urbanization, leading to environmental issues. Alternatives like manufactured sand (M-sand) have gained popularity, but more eco-friendly substitutes are still being explored. Waste foundry sand (WFS), a by-product of the metal casting industry, offers promise due to its fine particle size and high silica content, making it suitable for partial replacement of fine aggregates. This study investigates the use of WFS as a partial substitute for M-sand in concrete at replacement levels of 0%, 10%, 20%, 30%, and 40%. Key properties such as workability, compressive strength, split tensile strength, flexural strength, and durability were examined. Conplast SP430, a high-range water-reducing admixture, was incorporated to address the reduced workability caused by the fine texture and water absorption of WFS. Results indicated that workability decreased with increasing WFS content, but the use of Conplast SP430 mitigated this effect. Mechanical strengths were maintained or improved up to a 20%-30% replacement level, beyond which performance declined due to excessive fines. The use of WFS offers dual advantages-reducing industrial waste and conserving natural sand. The findings confirm WFS as a viable, sustainable alternative in concrete production when used within optimal limits and paired with suitable admixtures.

(57) Abstract :

ABSTRACT The-present invention relates to a compact planar near-field antenna configured to operate at 16 GHz for localized dielectric characterization of printed circuit boards (PCBs). The antenna comprises a dielectric substrate with a ground plane on its bottom surface and patterned metallic resonator structures on the top surface. A 15 coaxial feed excites the antenna to generate a spatially confined electric field in (i) the near-field region. The high operating frequency ensures improved spatial resolution and enhanced field confinement, enabling sensitive, non-contact dielectric interaction. The resonator geometry is optimized for sub-wavelength field localization, and the antenna exhibits impedance matching near 50 ohms, 20 with return loss less than -13 dB at 16 GHz. Electromagnetic simulations confirm the near-field electric field remains confined within a few millimetres from the surface. The invention focuses solely on the antenna structure and its electromagnetic behaviour, excluding any measurement instrumentation or mounting provisions.

(57) Abstract :

ABSTRACT: In recent years, object detection and counting have become pivotal tasks in computer vision, with applications spanning across surveillance, traffic monitoring, inventory management, healthcare, and crowd analysis. This project presents a robust and efficient object detection and counting system leveraging deep learning techniques. By integrating convolutional neural networks (CNNs) with state-of-the-art object detection algorithms such as YOLO (You Only Look Once), SSD (Single Shot Detector), and Faster R-CNN, our system is capable of identifying and quantifying multiple object classes in real-time with high accuracy.

## (57) Abstract :

ABSTRACT: The present invention discloses a next-generation wireless charging system for electric vehicles (EV s) that integrates multiple innovations to address the limitations of conventional wired and existing wireless chargers. This system leverages a highefficiency resonant inductive coupling mechanism, enhanced by a smart alignment and positioning subsystem utilizing a combination of inachine vision, infrared triangulation, and ultrasonic sensin~. These technologies collaboratively ensure precise coil alignment between the transmitter and receiver, thereby significantly improving energy transfer efficiency and minimizing charging losses due to lateral or angular misalignment. The innovation further includes a dynamic impedance matching network, which adapts in real time to changes in coil distance, load impedance, and battery state-of-charge, thereby optimizing power delivery and extending battery health. A modular EMI shielding framework-employing advanced materials such as mu-metal and embedded ferrite tiles-ensures compliance with global safety standards while preventing interference with nearby electronic devices. A cloud-enabled smart control unit, compliant with ISO 15118 ai:J.d Open Charge Point Protocol

(57) Abstract :  
ABSTRACT DEEP LEARNING-BASED SYSTEM FOR HUMAN ATTRIBUTE AND OBJECT SIZE ESTIMATION USING 2D IMAGES I The present invention relates to a method for estimating human physical attributes and object dimensions from a single two-dimensional image using deep learning techniques. The method involves the detection and classification of human subjects and non-human objects within the image, followed by the estimation of human attributes such as height, weight, body mass index (BMI), and age. Additionally, the method predicts the physical dimensions of non-human objects. A key feature of the method is the use of scale inference, which infers real-world scale information from facial landmarks and body proportions without the need for external calibration or multiple image captures. The method also includes an optional augmented reality (AR) overlay to display the predicted attributes and dimensions in real-time. This approach ensures privacy through encryption of sensitive data and provides a scalable, efficient solution for a variety of applications, including healthcare, retail, fitness, and augmented reality systems. The method leverages advanced deep learning models, including convolutional neural networks (CNNs) and attention-based mechanisms, to enhance prediction accuracy, even in cases of partial occlusions or non-standard poses. By processing images locally on the device, the method ensures minimal data transmission, enhancing privacy and efficiency. This innovation provides a robust, privacy-conscious tool for diverse industries, enabling precise, real-time human and object attribute estimation from simple 2D images .

(57) Abstract :

ABSTRACT: The present invention relates to the field of enterprise automation and artificial intelligence, specifically in the domain of automated communication systems, email task automation, and business process optimization. It integrates Excel-based databases, natural language personalization, and email dispatch systems (SMTP/APIs) for internal operations and client outreach .

(57) Abstract :

Abstract:· The invention Transforming ELT through JCT: Contemporary Practices and Future Directions pertains t'o a comprehensive system and methodological framework designed to analyze,' ! evaluate, and enhance the integration of Information and Communication Technology (ICT) tools in English Language Teaching (ELT) across academic institutions. This study introduces a research-oacked approach that incorporates data-driven survey instruments, adaptive feedback loops, and localized implementation strategies to assess the effectiveness of ICT in classroom language instruction. Conducted across three key districts in Andhra Pradesh-Guntur, Vijayawa'da, and Prakasam-the system collects and interprets quantitative and qualitative insights using· a 50-item instrument, addressing both pre-exist and emergent challenges, particularly those intensified during the COVID-19 pandemic. Core components include the examination of digital learning platforms, teacher and student ICT readiness, and institutional support structures. The proposed framework enables targeted improvements in instructional design, learner engagement, and technology adoption. By offering scalable solutions and actionable recommendations, this innovation empowers educators, policy-makers, and learners to cultivate technologically enriched, communicative competent learning environments, thus equipping1stakeholders with sustainable strategies for future-oriented ELT ecosystems .

(57) Abstract :  
ABSTRACT: This invention introduces an intelligent, IoT-enabled freshwater n::circulating and fish counting aquaponics system that integrates Convolutional Neural Networks (CNNs) for real-time fish disease detection and environmental monitoring. Designed to support sustainable and efficient fanning, the system continuously collects data on key water parameters such as temperature, pH and ammonia levels through IoT sensors. Using image-based analysis powered by CNNs, it identifies early signs of fish illness, enabling prompt intervention to maintain aquatic health. The system also features automated controls for adjusting water flow, aeration and feeding based on sensor input, ensuring optimal conditions for both plant and fish growth. Remote access via mobile or web platforms allows users to monitor and manage the system from any location. Scalable and data-driven, the invention supports various applications from small urban farms to large commercial operations, promoting eco-friendly food production while optimizing resource use and reducing environmental impact.

(57) Abstract :

ABSTRACT 1 The present invention explores the factors that contribute to emotional agility. A qualitative exploration among experts and young adults in India is employed for the qualitative exploration. This is a construct which is novel in the field of psychology and enables individuals to navigate emotions in a rapidly changing dynamic environment. But the clarity of how young adults in India view emotional agility is a gap. This invention discloses the factors that constitute a systematic processing of emotions by recognising them and responding more resiliently. The three components of cognitive, affective and behavioural elements constitute the basic framework from which the emotional agility framework is operationalised. The specific dimensions that constitute emotional agility include emotional awareness, detachment from emotions, adaptability, flexibility, value-aligned action and emotional expression. This framework is developed in the Indian context, exploring and incorporating perspectives by a qualitative enquiry. These models can be applied in various domains like professional development, personnel development, the clinical field, corporate training, organisation training, leadership training and mental health and well-being fields. This structure provides an innovative and novel method to access and enhance emotional agility for the young adults in India.

(57) Abstract :

The invention discloses a solar-powered gear pump-driven paint supply system designed for continuous and uniform paint delivery in roller-based painting applications. The system comprises a solar panel, a rechargeable battery, a charge controller, a compact gear pump, a sealed paint reservoir, flexible tubing, and a roller handle with an integrated paint channel and micro-perforated sleeve. Upon user activation, the gear pump draws paint from the reservoir and delivers it directly to the roller head, enabling efficient; mess-free painting without the need for manual dipping. The invention is portable, eco-friendly, and suitable for both indoor and outdoor environments, particularly in off-grid or power-limited locations

(57) Abstract :

ABSTRACT The invention relates to a non-electric, mechanically triggered light-generating capsule that emits visible light through a controlled chemical reaction. The capsule comprises two separate chemical chambers isolated by a movable separator and a central mixing zone where the reaction occurs. Positioned above the capsule are one or more air-filled, unbalanced balls placed on a platform. These balls respond to ambient airflow variations. caused by natural ventilation or human movement. When displaced, the balls activate a mechanical linkage that shifts the separator, allowing the chemicals to mix and generate light without electricity or manual contact. The system operates autonomously, is optionally reusable, and may be constructed using biodegradable materials. It is suitable for applications in emergency lighting, decorative use, spiritual settings, and off-grid environments. The invention offers a sustainable, low-cost, and passive lighting solution ideal for rural and energy-deficient regions

(57) Abstract :

ABSTRACT The invention discloses an AI-controlled bird deterrent device comprising a rotating spherical mirror made of multiple small reflective surfaces, illuminated by solarpowered LED lamps. The system uses a DC motor and gear setup to rotate the mirror, scattering light in multiple directions to deter birds. An AI-based controller processes sensor inputs to activate the system only when needed, enhancing energy efficiency. The device includes a wireless communication module for remote monitoring and a mobile alert system for user notifications. Designed for agricultural and open-field applications, the system offers an intelligent, eco-friendly, and automated solution for bird control.

## (57) Abstract :

ABSTRACT The present invention relates to a non-destructive system and method for extracting inner core and outer sheath water from a living banana plant, using a dual-channel hollow needle and washer-based fluid separation mechanism. The system enables simultaneous collection of two types of water from the pseudostem without cutting or killing the plant. The invention further integrates an AI-based electronic control module equipped with sensors to monitor needle depth, flow rate, internal stem pressure, and plant moisture. The system transmits real-time data to a mobile application via wireless communication (Bluetooth/Wi-Fi/Lora), enabling intelligent monitoring, decision-making, and traceability. The collected water is directed through separate flexible pipes into two airtight glass bottles for further use in nutraceutical, cosmetic, or agricultural applications. The invention addresses the need for sustainable, zero-waste agricultural practices and adds value to standing banana crops through smart, eco-friendly water extraction

## (57) Abstract :

ABSTRACT The invention relates to an AI-integrated, solar-powered desalination system that converts saltwater into potable water using thermal evaporation and condensation. It comprises a solar panel, battery, heating coil, saltwater chamber, condensation zone, and freshwater collector, enclosed in an eco-friendly casing made of banana sheath or coir. An AI unit monitors temperature, salinity, water level, and TDS via sensors and controls the heating process. Realtime data is accessible through a mobile app or cloud interface. The system operates off-grid without RO membranes or chemicals, making it ideal for rural, coastal, or remote regions requiring sustainable, intelligent water purification.

## (57) Abstract :

ABSTRACT The present invention relates to a smart multi-functional LED lamp system that integrates adaptive lighting control, motion sensing, air quality monitoring, audio alarm functionality, and wireless connectivity within a single compact unit. The system comprises a microcontroller, LED light source, motion sensor, air quality sensor, alarm buzzer, Wi-Fi module, and mobile application interface. The device operates in dual lighting modes full brightness during occupancy and night mode when idle and provides real-time air quality alerts through both a buzzer and a mobile app. A wake-up alarm feature synchronizes gradual light increase with audio signalling. Cloud connectivity enables data storage, remote configuration, and behaviour-based adaptation. The invention offers a plug-and-play smart lighting solution that enhances energy efficiency, user comfort, and environmental awareness, making it suitable for homes, healthcare, offices, and IoT-based infrastructures.

(57) Abstract :

ABSTRACT The invention relates to anAI-enabled, spider-type robotic device for automated wall surface cleaning and plaster repair. The device is equipped with multiple articulated legs or suctionbased climbing mechanisms to navigate vertical walls. A vision sensor powered by an AI module detects wall defects such as dirt, cracks, and damaged plaster. Based on the defect type, the robot activates either a cleaning module or a plaster injection module to perform surface maintenance. The system is powered by a rechargeable battery unit and can be controlled via a mobile application that provides live video feed, task scheduling, and battery monitoring. The invention eliminates the need for manual wall repair in difficult-to-reach areas, improves safety, ensures consistent quality, and is suitable for use in domestic and commercial building maintenance. The integration of AI, mobility, automation, and mobile app support makes the invention novel, non-obvious, and industrially applicable.

(57) Abstract :

ABSTRACT The present invention discloses a sustainable method for producing natural fiberbased bio-composite materials using post-harvest banana leaf and sheath waste. The method include~ steps such as cleaning, crushing, pulping, sheet formation, dehydration, pulverizing the dehydrated sheets into powder, and blending with natural bio-resins such as papaya latex. The resulting composite is moldable and can be shaped into toys, decorative items, and enclosures for functional products. A unique feature of the invention is the integration of electronic components including LEDs, sensors, and buzzers into the molded biodegradable structures, enabling the development of eco-friendly smart toys and home décor items. This process provides a scalable, cost-effective, and environmentally responsible solution for agricultural residue valorisation and sustainable manufacturing. The invention is particularly applicable for rural-based enterprises, SHGs, and micro-manufacturing units.

(57) Abstract :

Abstract A fuzzy graph IS a mathematical structure that incorporates the concept of uncertainty, or fuzziness, into traditional graphs. Classical graph theory depicts edges between nodes as binary relationships, showing the presence or absence of a connection between them. In contrast, fuzzy graphs can represent degrees of connection or membership, providing a more realistic and nexible framework for describing real-world systems with ambiguous or imprecise relationships. The idea of fuzzy graph labeling is to extend traditional graph labeling to handle vague information associated with vc1tices, edges, or both. Using this extension, relationships within a graph can be represented in a more nuanced manner, acknowledging that not all connections or characteristics arc absolute. This paper aims to study the concepts of anti-magic labeling for anti-fuzzy graphs. FUJthermore, we determine the edge anti-magic (EAM) and vertex anti-magic (YAM) for some classes of anti-fuzzy graphs, like cycle and comb, and derive the properties for the same

(57) Abstract :

Abstract The invention discloses an integrated, intelligent platform for real-time carbon emission monitoring, automated auditing, and blockchain-enabled carbon credit trading, specifically designed for industrial applications. The system utilizes a network of IoT-based environmental sensors to continuously measure emission levels such as CO<sub>2</sub>, NO<sub>x</sub>, SO<sub>x</sub>, and particulate matter. Collected data is transmitted to an AI-powered analytics engine that performs real-time analysis, anomaly detection, regulatory compliance checks, and emission forecasting. Based on audit outcomes, a carbon credit allocation module dynamically calculates credits or penalties for each industrial entity. These credits are managed and transacted through a blockchain-based trading system employing smart contracts to ensure secure, transparent, and tamper-proof transactions. A user-friendly dashboard allows stakeholders to visualize emissions, manage credits, receive alerts, and access compliance reports. The invention provides an end-to-end solution to support industries in achieving sustainability goals, regulatory compliance, and active participation in carbon markets.

(57) Abstract :

Abstract This invention relates to a revolutionary technique for extending the lifespan of diesel engine pistons, augmenting overall engine performance, and mitigating hazardous emissions by the application of a ceramic coating consisting of 60% fused. zirconia and 40% alumina. The coating is specifically applied to the crown region of aluminum pistons utilizing the plasma spray process. The fused ceramic composite markedly enhances wear resistance and diminishes heat losses during combustion. These enhancements facilitate a more efficient and thorough burning of the air-fuel mixture within the combustion chamber. Consequently, there is a significant improvement in thermal efficiency, a decrease in unburnt hydrocarbons and particle emissions, and an extended service life of the piston in high-temperature working circumstances. This technology offers an economical and resilient solution for contemporary CII diesel engines aiming for enhanced efficiency and compliance with rigorous emission standards.

(57) Abstract :

ABSTRACT The assessment process for automobile accident insurance claims is frequently intricate, · labor-intensive, and susceptible to errors or fraudulent activities owing to manual review techniques. This innovation presents an AT-driven system that employs deep learning techniques to autonomously evaluate the degree of vehicle damage after an accident. The technology utilizes image recognition and analysis to precisely assess damage severity, which is subsequently employed to determine a fair and objective insurance claim value. A Genetic Algorithm (GA) is employed to optimize the prediction ·process and improve accuracy. This invention utilizes artificial intelligence and evolutionary computation to enidicate false claims, underclaims, and overclaims, so assuring a transparent, efficient, and reliable insurance assessment process.

(57) Abstract :

Abstract This innovation introduces a Real-Time Earthquake Early Warning System (EEWS) based on a Real-Time Operating System (RTOS) framework, intended to provide swift, accurate, and directional seismic detection. This system employs embedded technologies like NodeMCU with built-in Wi-Fi, enabling immediate data collecting, processing, and wireless alert transmission to pertinent stakeholders, including farmers, disaster response teams, and local authorities. This system, unlike traditional EEWS solutions that provide broad alerts, features directional seismic wave detection, allowing for the identification of both the epicenter's direction and intensity. This information facilitates dynamic risk mapping and prioritization of evacuation tactics according to the anticipated severity in designated zones. The system incorporates a landslide susceptibility assessment module alongside seismic detection, which evaluates topography parameters, soil moisture, and seismic activity to predict landslide likelihood in susceptible agricultural areas. This feature is especially beneficial in mountainous regions and areas with substantial precipitation, where landslides present considerable risks after earthquake occurrences. The system transmits real-time notifications via Wi-Fi using NodeMCU, ensuring that farmers and rural communities typically the most impacted and least connected receive prompt warnings to safeguard their lives, livestock, and agricultural resources. The system prioritizes Health, Safety, and Environmental (HSE) protocols, incorporating alarms, evacuation instructions, and emergency power backup to ensure uninterrupted operation during power outages. The invention enhances the sustainability of agricultural practices by reducing disruptions from natural disasters and bolsters food security and economic stability by maintaining farmland productivity. This integrated system addresses seismic and geotechnical hazards in real-time, bridging a crucial gap in rural disaster preparedness and providing a scalable, cost-effective, and efficient solution for disaster-prone agricultural ... areas.

(57) Abstract :

B\_S\_T\_R\_A\_C T\_ ~~~~~ Urban waste management is a complex and resource-demanding endeavor, particularly in heavily populated urban areas. This proposal proposes the creation of a Smart Automatic Movable Dustbin to resolve this issue and enhance garbage collecting efficiency. This advanced waste receptacle is engineered to navigate urban streets autonomously, utilizing a 360-degree vacuum suction system to gather dispersed refuse. The trashcan features motorized wheels and a tracking system that permits 360-degree movement, facilitating access to rubbish from all angles. The motion is regulated via intelligent sensors and energized by a rechargeable battery system, rendering it energy-efficient and appropriate for uninterrupted operation during designated hours. The dustbin functions from 12:00 AM to 5:00AM, a timeframe characterized by limited human and vehicular traffic, hence assuring optimal cleaning with diminished risk and interruption. An inbuilt infrared sensor assesses the interior fill level of the trashcan. Upon reaching about 70% capacity, the bin transmits an automatic notification to the waste collection personnel via a GSM module. Furthermore, IoT technology facilitates the transmission of this status to the centralized waste management system for real-time oversight. The dustbin may autonomously navigate to the nearest disposal location where a garbageman will ,unload the gathered waste, either according to a timetable or when it is full. This system integrates intelligent .mobility, vacuum-based garbage collection, real-time monitoring, and autonomous disposal, therefore substantially diminishing manual labor requirements, enhancing operational efficiency, and fostering a cleaner, more intelligent, and sustainable urban environment. Multiple smart trashcans will be deployed to ensure more effective results. The initial implementation will begin in a remote rural area, such as a village. Following successful outcomes, the project is expected to gain government interest, leading to wider recognition and potential global adoption

(57) Abstract :

ABSTRACT This invention presents a hybrid passive and active vehicle cabin cooling system designed to deliver effective thermal comfort without relying on traditional engine-driven air conditioning. The system is particularly suited for commercial vehicles operating in hot and humid environments, where conventional cooling solutions are energy-intensive and expensive. At the core of the invention is an integrated architecture that harnesses the kinetic energy from vehicle motion, transforming natural airflow into a multi-stage cooling mechanism independent of engine power. The system utilizes a combination of passive airflow harnessing, thermodynamic expansion, thermoelectric fine-tuning and humidity control to deliver localized, efficient cooling. The process begins with aerodynamically optimized air intake ducts, positioned strategically at the vehicle's front or side panels to capture ambient airflow generated during motion. These ducts, equipped with adjustable louvers and debris filtration, funnel the incoming air into a roof-integrated flexible bladder. Constructed from multilayer polymer composites, this bladder serves both as a compressed air reservoir and as a buffer for noise, vibration and harshness (NVH). As the vehicle moves, air accumulates and compresses within this bladder. When cooling is needed, a controlled Qj expansion valve, actuated by a central control unit, releases the compressed air into the CI m system's ductwork. The valve precisely modulates air flow and pressure drop, ensuring optimal adiabatic expansion. This rapid expansion triggers a temperature drop, yielding cool air without the need for refrigerants. Downstream of the expansion process, a dedicated moisture removal unit utilizing either desiccant absorption or condensate separation extracts excess humidity from the cooled air, preventing cabin fogging and improving comfort. The dehumidified, chilled air then passes through an array of thermoelectric Peltier modules situated near the air outlets. These modules, powered by low-voltage electricity, provide targeted, responsive cooling that creates localized micro-climates for occupants. Finally, a system of ceiling-mounted ducts and adjustable vents distributes the conditioned air efficiently throughout the cabin. A low-power blower ensures continuous air circulation when the vehicle is stationary, drawing from the bladder's stored air supply. A centralized control unit governs all system operations by monitoring real-time data on bladder pressure, temperature differentials and vehicle motion. It dynamically coordinates valve actuation, ~ blower operation and Peltier activation.

(57) Abstract :  
The present invention discloses a compact, decentralized device for reforming mixed plastic packaging waste such as films, wrappers, multilayered packaging directly at the point of generation. The device utilizes thermomechanical densification via controlled heating and mechanical compression within a screw conveyor system, eliminating the need for pre-sorting by polymer type. Key components include a feed hopper for unsorted input, a screw conveyor within a heated barrel for conveying and softening plastic, a compression zone for densification, a cutting mechanism producing disc-shaped blocks and a cooling section for stabilization. The device operates without melting or extrusion, the process transforms waste into dense, solid, inert blocks that are non-toxic, non-leaching and odor-free. This results in significant volume reduction, facilitating efficient storage, transportation, and simplified downstream recycling. The device incorporates safety features such as thermal insulation, emergency shutoff, child lock, energy-efficient operation, and user-friendly controls suitable for domestic and shared environments. By enabling source-level decentralization of plastic waste management, this Q) approach provides a scalable solution to reduce littering, free storage space, prevent climate pollution and improve feedstock logistics for recyclers, fundamentally differing from conventional centralized sorting-grinding-melting-extrusion recycling systems.

(57) Abstract :

The invention discloses a system for generating electricity by utilizing buoyant force produced by floating containers in water tanks. The system comprises one or more water tanks, buoyant containers, a rope-and-pulley mechanism, a gear assembly, and an electric generator. As water levels rise in the tank, the buoyant containers ascend and pull the rope, thereby rotating a shaft connected to a gear system. The gear assembly amplifies the mechanical motion, achieving high rotational speed suitable for electricity generation. Water transfer between tanks is managed through a water motor or siphoning mechanism to enable continuous operation. The system functions independently of solar, wind, or hydro sources, providing a compact and location-independent renewable energy solution.

(57) Abstract :

With the rising complexity of manufacturing processes driven by advanced technological demands, particularly in the handicraft sector, traditional jewellery production faces limitations in meeting international market dynamics. Intricate jewellery designs are increasingly difficult to produce manually. However, advanced technologies like 3D printing are revolutionizing jewellery design and manufacturing, enabling the creation of high-quality products with reduced labour and production time. This study explores the use of investment casting integrated with 3D printed prototypes in jewellery manufacturing. Using the 'Angled Ring' design as a case study, the research outlines the complete process, from digital prototyping to vacuum-assisted lost wax casting, utilizing vacuum casting machines and burnout ovens. The casting process was analyzed in detail to evaluate outcomes. The findings contribute to a deeper understanding of modern casting techniques and highlight the future potential of integrating digital fabrication technologies in the jewellery industry

(57) Abstract :

Abstract The novelty and technical feasibility of this invention are illustrated by an IoTEnabled Autonomous Food Waste Composting Pod with Sensor-Based Microbial Optimization, which will solve the current global food waste problem by composting the food waste to be utilized as a fertilizer, all to be done automatically and efficiently. The system combines complicated sensor technology with smart control algorithms and connectivity through the Internet of Things (IoT) to provide an optimum microbial environment to decompose. In the composting pod, the composting chamber/reactor is durable where wastes of food are left to be processed. There is a hi-tech Sensor Array that constantly checks key parameters inside of this chamber, such as temperature, water, and gas compositions (e.g., CO<sub>2</sub>, methane, oxygen), and pH, giving instant feedback on the process of composting and microbe wellness. This data is in turn relayed through an IoT Connectivity Module to a Microcontroller/Processing Unit. Being the brain of the system, this unit will analyze the data collected by the sensors through the readyprogrammed algorithms to establish the optimum conditions to activate microbe. On the basis of this analysis the processing unit instructs an Actuation System for Optimization to do fine-tunings. This actuating mechanism allows controlling the degree of aeration with the help of fans, moisture content with the help of pumps or misters, and the activation of mixing or turning processes in order to maintain an even composition and a good distribution of oxygen. The computer control closedloop feedback system has the potential of automatically optimizing the composting environment, causing the compost to decompose rapidly, and producing excellent quality compost. The integration of IoT also allows remote control and observance, which provides ultimate convenience and effectiveness in terms of food waste management. This invention offers a long-term and automatic means of minimizing land fill trash and creates a useful soil amendment.

(57) Abstract :

Accidents are happened to human beings by various reasons. One of the n1ajor hazards often overlooked in many workplaces is, opening a door which could be so dangerous. If a door is pushed, it's swing along a set path can be observed. Anyone standing in that path way will be hit by the door, due to the swing and may results in terrible injuries. Unfortunately, tliere is no provisions to see the persons coming either side, as most facilities have solid doors that do not have windows. To overcome this problem, the present work aims to construct a safety device to eliminate the accident caused by door collision. The objective of the proposed device is fulfilled by employing sensors to avoid injury to the person on the other side of door when the door is opeiled. The ultra-sonic sensor helps to detect the person who is going to open the door and the information is send in the form of signal or alarm. The indication is kept on the other side, so that the person on the other side will able to recognize that someone is about to open the door, so that he will remain alert and any possible collision can be avoided

(57) Abstract :

Lifting and rising of loads is a part of regular activity in industry for various reasons. It requires adequate skill, expertise and attention while rising the load to avoid any incidents. Operators may inadvertently exceed the maximum load capacity risking equipment damage, and safety hazards, necessitating additional effort to address the situation. Further, two or more members are required to rise the load and the workers may become fatigue quickly. To overcome these limitations, a user-friendly device has been proposed and fabricated. The device is a hand operated lifting jack with a bevel gear arrangement identical to that of a screw jack. It is used to lift the weights back and forth from the bottom to the top. Bevel gears are used in this setup rather than worm gears that were used in screw jacks. This setup does not harm the screw threads quickly. The bevel gear design of the lifting jack makes it exceedingly portable. The hand operated lifting jack is used to lift heavy loads vertically by converting rotational motion into linear motion. It is designed to effortlessly lift heavy loads by applying relatively smaller forces.

(57) Abstract :

ABSTRACT A hybrid energy dryer machine for matchstick drying, an energy-efficient, fully automatic hybrid dryer machine designed for industrial-scale matchstick drying. It utilizes a dual energy system combining wood-fire:l heat and electricity-powered blowers and conveyors. A dual conveyor mechanism enables bi-directional heat application for complete and uniform drying. The system features an innovative heat recycling process that redirects partially spent air back into the heat exchanger, reducing fresh fuel requirements by up to 50%. Additionally, matchstick production waste serves as fuel, promoting a zero-waste manufacturing process. This design lowers operational costs, minimizes environmental impact, and improves drying efficiency and product quality

(57) Abstract :

ABSTRACT OF THE INVENTION The present invention relates to a wearable wildlife deterrent system specifically designed to enhance human safety in regions prone to tiger \_ encounters. The system integrates multi-sensory deterrent technologies 15 including ultrasonic emitters, strobe lighting, and directional sound within a compact, wearable module suitable for attachment to clothing, belts, or backpacks. Triggered either manually or automatically through a proximitybased motion sensor and thermal detection module, the device emits stimuli proven to deter large predators without causing them harm. The invention 20 also incorporates a GPS-enabled alert system that transmits the wearer's location and danger signal to nearby forest patrol units or emergency contacts via a connected mobile application. Designed for forest workers, villagers, and trekkers, the system ensures non-invasive deterrence, realtime tracking, and enhanced situational awareness in wildlife-human conflict 25 zones, thereby reducing the risk of fatal encounters and supporting conservation efforts.

(57) Abstract :

ABSTRACT OF THE INVENTION "Deep Learning-Based Recognition and Analysis of Tamil Ancient Inscriptions" provides a novel algorithmic approach for character recognition and contextual analysis of temple inscriptions, specifically focusing on Tamil ancient script. The methodology combines advanced preprocessing techniques, deep learning models, and contextual analysis to address the challenges posed by noisy images, script variations and historical context understanding. The proposed method employs image preprocessing techniques such as noise reduction, edge detection, and contrast enhancement to improve text recognition accuracy. This process involves character recognition, historical script comparison and linguistic translation to bridge the gap between ancient and modern Tamil language formats. The model's ability to recognize characters from multiple scripts underscores its adaptability to diverse inscriptions. It provides a comprehensive and efficient solution for character recognition and contextual analysis of temple inscriptions in Tamil ancient script. It advances the field of epigraphy and historical research, facilitating the digital preservation and exploration of historical and cultural heritage contained within these inscriptions.

(57) Abstract :

ABSTRACT OF THE INVENTION The invention relates to a roadway-based energy harvesting system designed to convert vehicle-induced mechanical motion into electrical energy. It features a compressible platform (101) that activates a rack and pinion mechanism (102), which transmits motion through a bevel gear (103) and flywheel (104) to a generator (105). The generated power is stored in a battery unit (106). The system is supported by a frame (107) and includes a servo reset mechanism (108). Optimized for speed breakers and toll plazas, the design is modeled using CATIA. It provides a decentralized, sustainable power solution for roadside infrastructure.

(57) Abstract :

ABSTRACT OF THE INVENTION 10 The invention presents a wireless sensor network (WSN) system for real-time monitoring and fault detection of three-phase induction motors. The system integrates temperature, vibration, current, and voltage sensors, which wirelessly transmit data to a central unit for analysis. The central unit uses advanced algorithms, including machine learning techniques, to identify and 15 classify potential faults, such as electrical issues (e.g., overload, single phasing) and mechanical failures (e.g., bearing wear, rotor imbalance). The system provides early fault detection, enabling proactive maintenance, reducing downtime, and extending motor lifespan. Additionally, it offers a user-friendly graphical interface for remote monitoring, allowing operators to 20 25 30 track motor health and receive real-time alerts. The wireless nature of the system simplifies installation and maintenance, while its scalable design allows for monitoring multiple motors in industrial environments. This solution enhances motor reliability, reduces maintenance costs, and improves operational efficiency in industries utilizing three-phase induction motors.

(57) Abstract :  
ABSTRACT OF THE INVENTION This invention discloses a system (1 00) for non-invasive, AI-d riven diagnosis of cardiovascular diseases using angiographic images from heart CT scans. The system utilizes a convolutional neural network (CNN)-based deep learning architecture (105) to analyze vascular structures and detect abnormalities such as blockages, aneurysms, and stenosis. The model training process (106) incorporates expert-annotated datasets and is optimized using data augmentation (107) and cross-validation techniques (108) to enhance prediction accuracy. Input images undergo preprocessing steps including contrast enhancement (102), noise reduction (103), and edge detection (104) using MATLAB-based tools to ensure clarity and consistency. The system outputs real-time diagnostic reports with severity scoring (109) and AI-generated treatment recommendations (110), providing clinicians with actionable insights to support timely and effective medical decisions. The final output includes visual overlays and probability scores that indicate the severity of vascular conditions, enabling early intervention and improved patient outcomes.

(57) Abstract :  
The growing integration of drones in diverse industries necessitates a structurally robust frame to ensure operational safety and reliability during dynamic flight. This study presents a detailed design and vibrational analysis of a quadcopter drone frame to evaluate its behavior under flight-induced conditions. The frame was parametrically designed in SolidWorks with a focus on achieving a lightweight yet mechanically resilient structure. Carbon fiber, with a high stiffness-to-weight ratio and a Young's modulus of 230 GPa, was chosen as the material. The 3D CAD model was analyzed using ANSYS Workbench for both modal and harmonic response evaluations. A high-resolution mesh, consisting of over 97,000 nodes and 52,000 elements, ensured precision in the results. The first six mode shapes, observed at frequencies below 0.01 Hz, indicated negligible or rigid body motion, while the primary elastic modes occurred at 765.5 Hz, 790.47 Hz, and 841.16 Hz-safely above the operational rotor frequency range, thus eliminating the risk of resonance. Harmonic response analysis simulated aerodynamic loads over a frequency range of 0-800 Hz. Results indicated a maximum deformation of 1.1443 mm and a peak von Mises stress of 201.34 MPa, both within the safety limits of the selected material. Strain and stress distribution confirmed the structural integrity under dynamic loading conditions. This comprehensive analysis validates the drone frame's resilience and safety for aerial operations, highlighting the critical role of modal analysis in early-stage drone design for ensuring performance reliability and structural durability.

(57) Abstract :

Abstract The biosynthesis of silver nanoparticles (AgNPs) offers a sustainable, eco-friendly alternative to conventional synthesis methods. This study utilized the marine sponge Hyattella intestinalis for the green synthesis of zoo-mediated AgNPs, leveraging its zoochemicals to reduce Ag<sup>+</sup> ions to Ag<sup>0</sup>. The biologically synthesized AgNPs were incorporated into a novel mouthwash formulation with potential anti-oral cancer properties. The cytotoxicity of the AgNP mouthwash was assessed against human oral squamous carcinoma (OECM-1) cells, showing a dose-dependent inhibition with a high correlation (R<sup>2</sup> = 0.99). These findings demonstrate the mouthwash's strong anticancer efficacy. The use of H. intestinalis also ensures minimal environmental impact, avoiding toxic byproducts associated with chemical synthesis. This study highlights the therapeutic potential of zoo-mediated AgNPs as a targeted, environmentally benign treatment for oral cancer, offering a promising alternative to conventional therapies and contributing to advancements in green nanotechnology for biomedical applications.

(57) Abstract :  
ABSTRACT OF THE INVENTION This Invention develops a machine learning-based Transparent OLED wearable system for real-time safety monitoring in hazardous environments like coal mines. It continuously analyses environmental data and worker conditions to detect dangers such as harmful gas exposure and temperature fluctuations, providing instant alerts. Equipped with high-sensitivity sensors for temperature, humidity, and gas "detection, it displays real-time data on a transparent OLED screen without obstructing vision. An intelligent alert mechanism, including audible and visual notifications, warns users of threats for prompt action. IoT connectivity via LoRa enables remote monitoring by supervisors. A predictive safety model, trained on historical and real-time data, enhances hazard detection by identifying risks early. Lightweight and wearable, the system ensures situational awareness with minimal distraction. Aligning with SDG 8 and SDG 9, this innovation improves risk management, accident prevention, and worker protection in high-risk industries.

(57) Abstract :  
ABSTRACT OF THE INVENTION 10 The invention pertains to a hybrid additive manufacturing system that integrates a LPBF process with an in-situ, layer-by-layer sandblasting module. In this configuration, each stratum of metal powder is selectively fused by a high-precision laser, followed by an in-situ sandblasting treatment that cleans and textures the freshly formed surface before to the application of the subsequent powder layer. Th~ design comprises a 15 precision laser scanner, a recoating system, an integrated abrasive nozzle, and a media recovery subsystem contained within an inert chamber. The new technology enhances surface quality, structural integrity, and mechanical performance in 3D-printed metal components. The hybrid system provides substantial benefits for sectors like aerospace, medical, and high-stress engineering components.

(57) Abstract :

ABSTRACT OF THE INVENTION This invention presents a smart classroom bench system embedded with sensors to automate student attendance, monitor posture, and analyze learning-related behavior. The bench utilizes load sensors and pressure-mapping arrays to detect seat occupancy and assess postural states such as slouching, leaning, or shifting. A microcontroller 315 processes real-time data locally and communicates with a cloud-based dashboard, enabling educators to view attendance logs, posture heatmaps, and engagement trends. The system includes alert mechanisms to notify instructors when students exhibit prolonged inattention or improper posture. All data acquisition is contactless, non-invasive, and privacy-compliant-no biometric or image-based identification is required. Designed for modular scalability and minimal disruption to classroom routines, 325 this invention transforms passive furniture into an active educational tool that supports well-being, improves monitoring accuracy, and enhances learning outcomes through data-driven insights.

(57) Abstract :

ABSTRACT OF THE INVENTION This project presents an advanced safety alert and real-time monitoring system for coal mines using MIoT technology. The system integrates sensors such as DHT11 (temperature), pressure, heart rate (SP02), and gas sensors to monitor both environmental conditions and 1 o miners' health. A microcontroller collects sensor data and transmits it to a mobile application, enabling real-time tracking. If any sensor detects unsafe levels, an instant alert is sent to a server station. Additionally, an embedded buzzer in miners' helmets provides immediate on-site warnings. To enhance safety, the system automatically triggers a servo motor to open an oxygen 15 cylinder when hazardous gas levels are detected. This proactive approach 20 ensures a rapid response to potential threats, minimizing risks in coal mining operations. By providing continuous monitoring and automated safety measures, the system significantly improves worker safety and operational efficiency in mining environments.

(57) Abstract :

ABSTRACT OF THE INVENTION This solution tackles drug trafficking by using ethical phishing to monitor illicit activities on communication platforms. It starts by ethically phishing drug consumers to install a stealth application that captures text, voice, video, images, and keystrokes. This data is securely uploaded and analyzed by a pre-trained Language Model (LLM) to detect drug-related communications. The system generates real-time reports and dashboards for the cybersecurity department, providing insights into drug trafficking networks. Upon judicial confirmation of a target's involvement, the system extracts the location and contact details using enhanced authentication. This information helps disrupt trafficking activities and identify other potential consumers and dealers. 15 The process adheres to legal and ethical standards, ensuring privacy and rights are protected. By leveraging advanced data analysis and visualization, this solution offers law enforcement a robust framework to combat drug trafficking effectively.

(57) Abstract :

ABSTRACT OF THE INVENTION Ensuring accessibility for visually impaired individuals is a crucial challenge in the modern digital landscape. This invention focuses on the development of an innovative Braille device integrating a 3x2 key matrix keyboard with a dynamic Braille display, supported by mobile software with multilingual capabilities. The device allows users to input Braille 20 characters via a tactile keyboard, which are then processed by an Arduino-based microcontroller and transmitted via Bluetooth to the mobile application. The mobile app, embedded with Text-to-Speech (TTS) technology, provides real-time auditory feedback, enabling seamless interaction. To enhance usability, the device incorporates natural language processing (NLP) for accurate text translation and tactile feedback to confirm inputs. It is designed to be portable, cost-effective, and energy-efficient, making it a viable solution for independent learning and communication. The system ensures compatibility with modern digital platforms, promoting inclusivity and empowering visually impaired users with efficient real-time text conversion and speech output.

(57) Abstract :

ABSTRACT OF THE INVENTION: This invention presents an advanced AI-driven system tailored for real-time, emotional support and counseling, designed to offer immediate and personalized mental health assistance through voice interaction. The system combats common challenges in mental health support, such as the lack of immediate access, difficulty in interpreting complex emotional states, and the provision of generic, non-personalized responses. Utilizing a machine learning framework that incorporates Natural Language Processing (NLP) and Emotional Recognition, the system detects and analyzes user emotions from voice inputs, enabling real-time, customized communication tailored to each user's specific needs. The system integrates advanced speech-to-text (STT) and text-to-speech (TIS) technologies to ensure fluent and empathetic voice interactions. Additional features include a data management module that stores interaction histories to enhance learning and adaptation to individual preferences, a user feedback mechanism to refine response strategies, and a privacy preservation module to ensure the confidentiality of personal data.

(57) Abstract :  
ABSTRACT OF THE INVENTION Women Safety Enhancement Tool Using Raspberry Pi will provide a dependable, easyto- use safety tool for women when they are at night or in risky situations. It allows users to send emergency alerts along with pre-recorded audio messages to the care taker, law 10 enforcement, and family with the help of GPS tracking, cloud-based audio transmission, and real-time heart rate monitoring. The heart rate sensor indicates raised pulse rates, indicating stress or panic, allowing responders to determine the extent of the situation. More than that, though, it provides a network of supportive community members and emergency responders that help minimize violence and harassment. It also seeks to 15 promote scalable solutions that may partner with law enforcement agencies in an effort to m•k• womoo'• •••~ ""~ "" "" "" • bott" •ootot•t ooo.otoij

(57) Abstract :  
The present invention discloses a highly integrated and programmable quantum simulation platform utilizing ultracold fermionic Lithium-6 atoms confined in a two-dimensional optical lattice, combined with atom-resolved quantum gas microscopy and a chip-scale control architecture. The system enables the real-time emulation of strongly correlated quantum systems, condensed matter phenomena, and quantum information dynamics with unprecedented precision. In this method, Lithium-6 atoms are first cooled to quantum degeneracy using a synergistic combination of evaporative cooling, Raman sideband cooling, and magneto-optical trapping. These atoms are then loaded into a dynamically configurable 2D optical lattice formed by interference of precisely phase-locked laser beams. The lattice potential depth, geometry, and inter-site spacing are tunable in situ, supporting multiple topologies including square, triangular, and honeycomb lattices. A quantum gas microscope with a high numerical aperture objective lens is employ

(57) Abstract :

This research aimed to investigate the use of zeolite and waste glass aggregate as a viable partial replacement for cement and sand in concrete. The mechanical properties of fresh and hardened concrete were noted to determine the feasibility of waste glass in concrete and to study the materials in concrete. Concrete produced with waste glass aggregate replacing sand 15% and natural zeolite replacing cement in 5 %, 10 %, 15 %, 20 %, 25 % addition of each, in these tests the waste soda glass bottles are used. Compression test, flexural test, and microstructural investigation were performed on the specimens. The findings indicate that desired strength is produced in 15 % replacement of waste glass aggregate and 10 % replacement of zeolite in cement. The experimental results suggest that the use of waste glass aggregate and zeolite will provide good alternatives to sand and cement and can be used effectively in industrial applications. Keyword: Zeolite, Waste glass aggregate, Compression test, Split tensile test,

(57) Abstract :

This invention investigates the three layers of natural fibers were sandwiched between glass fibers to make the hybrid laminates to get four different stacking sequences, i.e., GAAAG, GRRRG, GARAG and GRARG respectively. Wear test were carried out to test their tribological properties. It is observed that the GRRRG hybrid laminate exhibited very high coefficient of friction compared to GAAAG, GARAG and GRARG hybrid laminates used for this research. The epoxy resin that acted as the matrix element occupied the outer surface as well as the intermediate layers that separate and bind the reinforcement fibers. The relatively high coefficient of friction of the hybrid laminate GRRRG is related to the change in chemical properties of the epoxy resin while it reacted with the roselle fibers. The intense frictional force increased the rate of material removal which resulted in the sudden reduction of the frictional force. The presence of aloe vera fibers interrupted the reaction that occurred between the roselle fibre

(57) Abstract :

SENSE-COOK is an AI-powered smart kitchen innovation that brings real-time nutritional monitoring directly into the cooking environment. It integrates an edge AI camera with a powerful microcontroller to detect ingredients, estimate weight through monocular depth, and calculate nutritional values such as calories, carbohydrates, proteins, and fats—all on-device without cloud dependency. This solution eliminates the need for kitchen scales or manual food logging, offering a hands-free and privacy-focused alternative to existing health-tech applications. Traditional food-tracking solutions are limited by manual input, static image analysis, and reliance on cloud services, leading to inaccuracies, delays, and privacy risks. SENSE-COOK addresses these issues through on-device AI inference and real-time analysis. By estimating the volume of ingredients from camera-captured dimensions and combining it with a built-in nutrition database (per 1g basis), the system delivers instant and personalized health feedback d

## (57) Abstract :

Personalized recommendation systems have become keys to enhancing user experience in the digital world, where users are definitely subjected to information overload through vast amounts of movies available. The work here will develop a movie recommendation system based on Python and Flask. Users will be able to input their preferences such as preferred performers, genres, and ratings of previously seen films for personalized recommendations. With its use of content-based filtering techniques, it identifies similar movies in features and ensures relevance in the recommended results it gives. It does not use complex libraries or huge amounts of data and relies on the lightweight Flask framework that makes it user-friendly, efficient, and simple for scalability. The recommendation logic delivers suggestions with minimal computing overhead by concentrating on such basic characteristics as genre, director, and user ratings. Feedback by users in terms of commenting about recommended movies allows improving over

(57) Abstract :

In the modern digital world, people have been more and more asked to memorize various passwords to use different applications online. Such a trend leads to some vulnerability such as password fatigue, weak or reused passwords, and a risk of increased data breaches. The proposed Password Manager project is a holistic, secure, and user-friendly solution for password management in the effort to eliminate these vulnerabilities. The critical functionalities of the application involve generating strong, randomly potent passwords, safe storage of sensitive credentials with advanced algorithms in encryption such as AES-256 and access to password with a single highly secured master password. The Advanced functionalities such as cross-device syncing support, autofill for the web browsers, strength of analysis of passwords, and alert features about real-time breaches help strengthen the usability and security of the system. The project uses a strong technological stack: Python is used in the backend, and React.js for

(57) Abstract :

Automated tracking and management system for poll responses in a efficient This is real-time monitoring, automated data comparison, and structured report generation the the accuracy of response tracking and engagement management the expected The real-time monitoring module captures poll data dynamically, extracts response information from volatile memory to identify and notify immediately if unavailable participants respond. The system an automated log analysis engine to match the participants' response data with that of the uploaded participant list (CSV file) to identify high-precision non-responders. Furthermore, the system an AI-driven detection mechanism to enabling predictive analysis of engagement trends. The system is also to privacy and security frameworks and Chrome Content Security Policy (CSP) user data and unauthorized access. Thnction enables users to structured reports in CSV format, improving record-keeping processes and integration with other external tools. Designed for scalability and adapt

(57) Abstract :

This project presents an innovative Cockpit Intelligence System designed to improve vehicle safety, optimize driving performance, and maintain cabin well-being. The system continuously gathers and analyzes real-time data from various onboard sensors to assess the mechanical state of the vehicle and monitor operational parameters. Simultaneously, it evaluates driver patterns and physiological indicators to detect any deviations that may affect safe driving. The integrated vision module observes driver attentiveness and cognitive state, while specialized sensors track in-cabin environmental quality to ensure passenger comfort. By combining data-driven analytics with proactive alerts, the system aims to minimize risks, support timely interventions, and contribute to a more intelligent, responsive driving experience.

(57) Abstract :  
We disclose a novel SRAM architecture that uses Fully Depleted Silicon-On-Insulator (FDSOI) technology with dynamic back-biasing for real-time threshold voltage modulation. The invention features an optimized 6-transistor cell where forward body bias enhances performance during active mode and reverse body bias minimizes leakage during standby. The architecture improves static noise margins and ensures robust read/write operations under process-voltage-temperature variations. A hierarchical array organization integrates peripheral circuits for efficient control and supports power gating idle blocks. The cell layout leverages FDSOI's reduced well spacing to minimize area. Simulations at the 22nm FDSOI node demonstrate a 30% leakage reduction, a 25% SNM improvement, and a 40% area savings over conventional CMOS SRAM.

(57) Abstract :

This work presents the design and implementation of an AI powered agricultural monitoring system using IoT based automation and environmental sensing. The system incorporates an array of environmental sensors (100) to collect real time data, including soil moisture (101), temperature (102), and gas concentration (103). The AI model (110) processes this data to monitor plant health and recommend actions. The collected data is transmitted to a central control unit via an IoT module (108), which further analyzes trends and issues alerts when necessary. A web based platform (109) provides users with real-time updates on environmental conditions and irrigation needs. A mobile robot equipped with ultrasonic sensors (104) autonomously navigates a monitored area, capturing diverse data points while avoiding obstacles. A motorized irrigation system (106) ensures optimal water distribution. The system enhances agricultural efficiency, reduces labor dependency, and improves overall crop management by continuously monitoring environmental conditions and automating essential processes,.

(57) Abstract :

An energy-efficient Single Input Multi Output (SIMO) Two-Transistor Forward Converter-based EV charging system is disclosed. It supports simultaneous charging of multiple battery modules from a single power input, preferably sourced from renewable energy. Key innovations include pulse-shift control via MOSFET switching, a high-frequency charge controller, and real-time microcontroller-based monitoring. The system minimizes thermal losses, enhances battery life, and adapts dynamically to load conditions, offering a scalable and sustainable solution for EV charging infrastructure.

(57) Abstract :

The integration of Artificial Intelligence (AI) and Machine Learning (ML) into the banking and financial services sector is revolutionizing traditional operations, enhancing efficiency, and fostering innovation. The adoption of AI and ML also facilitates compliance with evolving regulatory requirements by automating reporting processes and monitoring transactions for suspicious activities. This proactive approach not only ensures adherence to legal standards but also reduces the risk of human error and operational costs. Despite the promising advancements, the implementation of AI and ML in banking presents challenges, including data privacy concerns, ethical considerations, and the need for robust cybersecurity measures. Financial institutions must navigate these complexities to harness the full potential of these technologies responsibly. The transformative impact of AI and ML in banking is evident across various domains, from enhancing customer interactions to streamlining internal operations.

(57) Abstract :

ABSTRACT OF THE INVENTION This study proposes an IoT-based Fisherman Border Alerting System to enhance maritime safety using LoRaWAN, ultrasonic sensors, and real-time data management. Traditional vessel monitoring near restricted maritime boundaries is labor-intensive and error-prone. This system integrates data from both a buoy and a fishing boat to detect, log, and alert when vessels approach predefined boundaries. An ultrasonic sensor, acting as a radar, accurately measures distance and angle. When the boat is within 500 meters of the buoy, it transmits a unique vessel ID via LoRaWAN for secure, long-range communication. Real-time alerts and data are logged using Google Sheets and the Blynk app, enabling fast response and high reliability. A mobile-friendly interface enhances accessibility for users. The system offers a scalable and efficient solution to reduce accidental border crossings. Future enhancements include GPS integration, additional sensors, and expanded coverage, contributing to a more robust and intelligent maritime safety infrastructure for fishing communities.

(57) Abstract :

This invention presents an intelligent energy management framework for electric vehicle (EV) charging systems powered by hybrid renewable sources, including solar, wind, and piezoelectric energy. Sensor data is continuously monitored to evaluate the available power from each source. Based on real-time efficiency and priority, the system selects the optimal energy source for charging the EV or storing surplus energy in the battery. Additionally, an IoT module transmits operational data to the cloud for monitoring and analytics. This approach ensures efficient power utilization, reduced dependency on the grid, and enhanced sustainability of EV infrastructure using smart, renewable-driven charging mechanisms.

(57) Abstract :  
The present invention discloses an intelligent, adaptive system for optimizing workforce allocation in environments where employees possess multiple, overlapping skill sets and tasks . . vary dynamically in complexity and urgency. The invention introduces a neural networkbased optimizer that leverages historical performance data,, real-time operational inputs, and advanced learning algorithms to assign personnel to tasks in an efficient, scalable, and contextaware manner. The system comprises a multi-layered deep learning architecture combined with a reinforcement learning loop, enabling continuous improvement of task-employee mapping strategies based on outcome feedback. It accounts for complex factors such as employee skill matrices, task interdependencies , shift constraints, resource availability, and employee workload balance. By modeling both hard constraints (e.g., certification requirements, availability) and soft constraints (e.g., preferences, learning potential), the optimizer ensures high task coverage, minimal idle time, and enhanced workforce engagement. A key innovation lies in the system's ability to evolve over time-learning from successful and unsuccessful allocations, responding to organizational changes, and improving with each iteration. The invention also includes a user-friendly dashboard interface, which allows human managers to monitor recommendations, override allocations, and interact with the AI engine in a transparent manner. This invention is applicable across multiple sectors, including manufacturing, healthcare, logistics, IT services, and customer support, offering organizations a robust and intelligent solution to maximize workforce productivity in multi-skilled operational environments

(57) Abstract :

ABSTRACT: The invention introduces an AI-enabled unmanned aerial vehicle (UAV) and missile system that integrates Generative Adversarial Networks (GANs) and YOLOv8-based computer vision with thermal detection to achieve high precision, autonomy, and cost efficiency. This system is designed to adapt to dynamic environments, providing real-time object detection, obstacle avoidance, and intelligent flight path correction. GANs are used to automate the aerodynamic and structural design of UAV components, enabling rapid prototyping through AI-optimized 3D models. These designs are directly fed into a monitored 3D printing system, where an AI agent adjusts print parameters in real-time to ensure structural quality, reduce material waste, and allow fast manufacturing even in low-resource environments. The onboard YOLOv8 model processes visual and thermal inputs to detect obstacles, heat signatures, and targets in real time. Trained on both standard and thermal datasets, this enables reliable navigation and target recognition in low-visibility or GPS-denied areas. The fusion of visual and infrared data ensures the missile or UAV can make decisions independently during missions, increasing operational success. For missile applications, the system employs deep reinforcement learning to correct trajectories mid-flight using sensor fusion from IMUs and visual data. This reduces targeting error and ensures high strike accuracy. Logical separation between the UAV flight control and missile guidance systems enhances performance reliability under complex mission conditions. The entire platform supports secure over-the-air firmware updates with encryption and rollback protection, ensuring adaptability for long-term deployment. The combination of generative design, intelligent navigation, and efficient manufacturing offers a powerful solution for both civilian and defense applications, delivering a low-cost, modular, and intelligent aerial system.

(57) Abstract :

ABSTRACT OF THE INVENTION 15 Life is invaluable, yet deep-sea rescues remain significantly more challenging than land- based operations due to low recovery rates and prolonged response times. To address this critical issue, this research presents an advanced Man-Over-Board (MOB) detection and tracking system that leverages RSSI (Received Signal Strength Indicator), cutting- edge sensors, and wireless communication technologies to enhance rescue efficiency. 20 The system integrates wearable and embedded MEMS sensors that continuously transmit real-time data via RSSI, enabling precise location tracking. A responsive GUI provides instant alerts to the crew, ensuring rapid intervention. Additionally, predictive AI algorithms and inter-IoT frameworks facilitate seamless communication between vessels and rescue teams, optimizing coordination and minimizing delays. By 25 combining intelligent monitoring with automated and manual activation mechanisms, this innovative approach significantly improves mid-sea rescue success rates, making maritime operations safer and more responsive to emergencies.

(57) Abstract :

ABSTRACT OF THE INVENTION 5 The Public Distribution System (PDS) plays a critical role in ensuring equitable access to resources in India, a country with a vast and densely populated population. Managing the PDS manually is highly complex and inefficient, necessitating automation for effective operation. While some level of automation exists in the current PDS, it primarily focuses on revenue-based processes, leaving commodity-based automation to underdeveloped. Regional variations in food preferences, quality, and quantity of commodities, coupled with affordability challenges for low-income beneficiaries, further complicate the system. Many individuals cannot purchase their entire monthly rations due to financial constraints, requiring a flexible system where rations can be collected incrementally based on earnings and requirements. To address these issues, this 15 project proposes an automated system integrating mechanical systems, electronic devices, and computing technologies to enable both cost-based and quantity-based dispensing of rations. Centralized monitoring will allow authorities to track consumption patterns in real -time, ensuring efficient resource management, affordability, and enhanced service delivery. This modernization aims to transform India's PDS for better 20 equity and operational effectiveness.

(57) Abstract :  
Urban traffic congestion poses challenges to mobility and route optimization. This invention introduces a machine learning-based traffic prediction and optimization system integrating CNNs for spatial analysis, LSTMs for temporal trends, SVR for traffic volume estimation, and HA for baseline reference. The system processes GPS, traffic camera, and historical data, applying noise reduction and feature extraction for improved accuracy: A route optimization module dynamically evaluates congestion levels and suggests efficient paths using traffic scores and geographic mapping services. Adaptive learning mechanisms refine predictions in real-time, while visualization techniques like congestion heatmaps enhance decision-making. Designed with a scalable cloud-based architecture, the system integrates with smart city infrastructure for real-time communication with traffic centers. An interactive dashboard provides live congestion forecasts and optimized route recommendations, enabling data-driven traffic management and enhanced urban mobility.

(57) Abstract :  
The present invention discloses a Cognitive Diversity Mapping System (CDMS) that utilizes Federated Artificial Intelligence (FAI) to enable inclusive, privacy-preserving recruitment by identifying and evaluating diverse cognitive styles among job candidates. Unlike traditional AI-based recruitment systems that rely on centralized data processing and surface-level qualifications, this invention introduces a decentralized architecture that maintains data privacy while analyzing rich, behavioral, and psychometric indicators from distributed sources. The system comprises a Federated Learning Engine that trains localized AI models across various data nodes-such as educational platforms, corporate HR systems, and candidate assessment platforms-without aggregating sensitive personal data. Candidate profiles are processed by a Cognitive Profiling Module, which extracts and interprets multiple dimensions of cognition including reasoning styles, decision-making behavior, and problem-solving approaches. A central Cognitive Matchmaking & Diversity Mapping Engine aligns these profiles with rolespecific or team-specific cognitive diversity goals, generating a Cognitive Diversity Index (CDI) to guide fair and innovation-oriented recruitment. The system is reinforced by an Adaptive Learning Loop that incorporates post-hire feedback and evolving team dynamics, enhancing predictive accuracy over time. Additionally, a robust Privacy and Compliance Layer ensures adherence to global data protection laws through differential privacy, encryption, and consent-driven data protocols. A dynamic dashboard interface allows recruiters and hiring managers to visualize cognitive maps, analyze diversity patterns, and simulate team configurations.

(57) Abstract :  
The present invention relates to a novel smart nano-coated film system engineered for selfregulating thermal insulation, specifically designed for extreme and dynamic thermal environments encountered in space applications. The invention comprises a multilayered thin film structure that integrates thermoresponsive nanoparticles, phase-modulating polymers, and infrared-reflective nanocoatings, allowing the film to autonomously modulate its thermal conductivity and emissivity in real time. The core functionality is enabled by nanoparticles such as doped vanadium dioxide (VO2) that undergo temperature-induced phase transitions, enabling the material to switch between insulating and radiative states based on ambient thermal conditions. An embedded infrared- reflective nanolayer, constructed using materials like indium tin oxide (ITO) or silver nanowires, reflects excess solar infrared radiation at high temperatures while permitting absorption and retention at lower temperatures. The outermost layer is composed of self- healing, radiation-resistant polymers that protect the film from micrometeoroid impacts, UV degradation, and atomic oxygen erosion. The system operates passively without the need for electrical input or mechanical components, reducing energy consumption and payload weight. It can be applied to satellite surfaces, spacecraft exteriors, modular space habitats, and other space infrastructure requiring intelligent, lightweight, and autonomous thermal protection. The film is compatible with roll- to-roll manufacturing, ensuring scalability and integration flexibility across diverse aerospace platforms. This invention addresses a significant technological gap by introducing a fully passive, adaptive, and intelligent thermal insulation solution, enhancing the efficiency, resilience, and operational lifespan of space missions, while also enabling future applications in terrestrial sectors exposed to harsh or variable climatic conditions.

(57) Abstract :

The present invention discloses a Quantum Driven Workforce Scheduling Optimizer specifically designed for hyper-agile organizational environments where traditional scheduling systems fall short due to high variability, real-time decision needs, and multidimensional constraints. This intelligent scheduling platform harnesses the computational capabilities of quantum annealing and hybrid quantum-classical optimization to dynamically allocate workforce resources in response to rapidly changing operational conditions. The system comprises five integral components: (1) an Input Acquisition Layer that gathers real-time workforce data; (2) a Preprocessing and Constraint Modeling Engine that enuudcj\* organizational rules and scheduling parameters into a quantum-compatible format; (3) a Quantum Optimization Core that transforms the scheduling problem into a QUBO matrix and computes optimal solutions using quantum logic; (4) an Adaptive Feedback Loop that integrates performance data to improve future scheduling decisions; and.(5) a User Interaction Interface that enables managerial oversight, scenario simulation, and real-time decision \* control. By converting workforce scheduling challenges into solvable quantum optimization problems, the invention enables superior allocation outcomes that consider employee skills, availability, ft cost-efficiency, compliance, and satisfaction in a single framework. Unlike AI-only systems that rely heavily on past data or traditional rule-based software that struggles with scale, this optimizer delivers rapid, high-fidelity workforce schedules in volatile, multi-project, cross-functional, and decentralized work environments. This innovation establishes a new paradigm in human resource planning by enabling quantum-accelerated, learning-based, and scenario-sensitive workforce scheduling, paving the way for highly adaptive and future-ready organizational operations.

(57) Abstract :  
ABSTRACT The present invention discloses an AI-powered long-short trading strategy generator with realtime news feed optimization, designed to enhance alpha generation in financial markets through advanced machine learning and natural language processing techniques. The system introduces a novel, adaptive framework that dynamically processes unstructured news data, evaluates market sentiment, and generates optimized trading signals with superior speed and accuracy compared to conventional quantitative models. Key innovations include: 1. Areal-time NLP engine incorporating domain-specific transformer models (e.g., FinBERT) for context-aware sentiment scoring, capable of processing news, social media, and earnings transcripts with sub-second latency. 2. A hybrid machine learning architecture combining supervised learning for asset selection and reinforcement learning for dynamic portfolio optimization, enabling continuous adaptation to shifting market regimes. 3. A closed-loop execution system featuring sentiment-aware order routing, real-time risk adjustments, and automated hedging based on news-driven volatility triggers. 4. A self-optimizing AI core that employs online learning and genetic algorithm components to evolve trading strategies without look-ahead bias. The invention addresses critical limitations of existing systems—including delayed news processing, static factor models, and overfitting risks—by introducing real-time information integration and adaptive decision-making. Backtested results demonstrate 15-25% annual return enhancement for market-neutral strategies with 30-40% reduced drawdowns during volatility spikes. Designed for institutional investors, hedge funds, and proprietary trading firms, this system establishes a new standard for AI-driven quantitative trading by bridging the gap between unstructured news data and executable trading strategies. The patent covers the unique system architecture, methodology, and applications across equities, commodities, and derivatives markets.

(57) Abstract :  
The present invention introduces a Causal AI Model for Identifying Hidden Drivers of Variance in Management Accounting, a groundbreaking framework that transforms traditional variance analysis into an explainable, prescriptive decision-support system. By integrating causal artificial intelligence (AI) with domain-specific accounting knowledge, this model overcomes the critical limitations of conventional approaches that rely on correlation-based analytics or black-box machine learning. Technical Field The invention resides at the intersection of management accounting, causal inference, and explainable AI (XAI), specifically addressing the challenge of identifying root-cause drivers behind financial and operational variances in business performance. Core Innovation The model employs a multi-layered analytical architecture combining: 1. Hybrid Causal Discovery- Leveraging Bayesian networks, structural causal models (SCMs), and Granger causality tests to uncover latent relationships between accounting variances and operational, behavioral, and external factors. 2. Dynamic Variance Decomposition- Utilizing Shapley value attribution and hierarchical clustering to separate controllable vs. uncontrollable variance components while quantifying interaction effects. 3. Counterfactual Simulation- Enabling "what-if" scenario testing with accounting-aware constraints to evaluate potential corrective actions. 4. Explainable AI Integration- Generating interpretable causal graphs and natural language reports that translate statistical findings into actionable managerial insights.

(57) Abstract :

The invention. discloses an intelligent, real-time decision-support system that integrates a Digital Financial Twin (OFT) with AI-driven risk auditing capabilities to enable more accurate, agile, and compliant corporate financial decision-making. The OFT replicates an organization's financial structure-including balance sheets, income statements, cash flows, and financial ratios-in a dynamic digital environment that updates in real time through continuous ingestion of internal and external data sources. At its core, the invention features a machine learning-based risk auditing module that autonomously analyzes transactional data, identifies anomalies, flags compliance risks, and provides predictive insights into potential financial disruptions. The system also incorporates a scenario simulation engine that allows finance professionals to test the impact of various strategic decisions, such as restructuring, acquisitions, or regulatory changes, under varying macroeconomic conditions. The OFT is equipped with a smart interface that translates complex outputs into intuitive dashboards, providing decision-makers with forward-looking risk assessments, optimization recommendations, and audit trails. The system continuously evolves through feedback loops and historical learning, making it capable of adjusting to new financial patterns and regulatory updates with minimal manual intervention. This invention addresses major limitations in traditional financial planning, which is often reactive, fragmented, and static. By unifying simulation, compliance, and intelligence within a single, adaptive digital framework, the proposed system transforms financial management into a strategic, predictive, and risk-aware function, offering a groundbreaking shift in how corporations navigate uncertainty and complexity in financial environments.

(57) Abstract :

The present invention discloses a Smart Ledger Analyzer-an intelligent, automated system developed to forecast working capital requirements by analyzing financial ledger data in real time. The system leverages machine learning, financial analytics, and contextual business intelligence to transform traditional ledger entries into predictive insights that assist businesses in short-term liquidity planning and strategic decision-making. The invention comprises a multi-layered architecture featuring a data ingestion layer that extracts transactional information from various ledgers, including accounts receivable, accounts payable, inventory, and cash flows. A preprocessing module then cleanses and standardizes the data, while a feature engineering module derives critical financial indicators such as DSO, DPO, inventory turnover, and cash cycle efficiency. At its core lies an adaptive forecasting engine powered by AI algorithms capable of detecting historical patterns, modeling financial behavior, and projecting future working capital needs with high accuracy. The system continuously learns from deviations between projected and actual outcomes, refining its predictions over time. It incorporates business-specific variables such as credit terms, vendor reliability, customer payment trends, seasonal variations, and operational growth cycles. An integrated risk detection module triggers alerts for potential cash shortages, collection delays, or inventory mismatches. All forecasts and recommendations are displayed on a userfriendly dashboard that provides real-time visualizations, actionable insights, and decision support for finance professionals. This invention surpasses existing systems by offering a fully automated, intelligent, and adaptive tool that eliminates manual forecasting errors and enhances liquidity management across enterprises of all sizes. It is particularly valuable for small and mid-sized businesses lacking dedicated financial planning infrastructure. By enabling proactive control over working capital, the Smart Ledger Analyzer helps organizations improve financial agility, reduce operational risk, and achieve sustainable growth.

(57) Abstract :

The present invention discloses a Swarm AI Based Warehouse Orchestration System that revolutionizes warehouse logistics through a decentralized, intelligent, and adaptive framework for autonomous asset movement. Unlike traditional warehouse management systems that rely on centralized control, the proposed system employs a network of autonomous mobile units (AMUs), each embedded with lightweight artificial intelligence and swarm behavior protocols. Inspired by natural swarm systems such as ant colonies and bird flocks, each AMU independently senses its environment, communicates with neighboring units, and makes realtime navigation and task decisions based on local stimuli and shared cues. The system utilizes a distributed architecture wherein decision-making is decentralized, enabling the entire network of agents to collectively coordinate tasks such as picking, sorting, transporting, and restocking inventory. The invention introduces a swarm intelligence engine within each AMU that governs behavior through local rules including dynamic task bidding, path selection, obstacle avoidance, and stigmergic coordination. These units interact over a peer-to-peer mesh communication layer and leverage environmental markers, digital trails, and feedback loops to achieve emergent global optimization without human intervention or central command. The system interfaces with existing Warehouse Management Systems (WMS) through a middleware module, facilitating seamless integration, task synchronization, and real-time inventory updates. It is highly scalable, fault-tolerant, and adaptive to warehouse layout changes, varying workloads, and operational anomalies. Over time, AMUs improve their efficiency through local learning mechanisms and experience-driven adaptation. This invention delivers a disruptive, intelligent orchestration solution that enhances throughput, minimizes latency, reduces infrastructure rigidity, and empowers flexible, resilient warehouse automation through a biologically inspired, decentralized AI framework

(57) Abstract :  
The present invention discloses a Quantum Optimization Engine designed to enhance the efficiency of warehouse operations by simultaneously optimizing item slotting and order picking in high-density storage environments. Leveraging quantum annealing and hybrid quantum-classical algorithms, the engine transforms complex logistics problems into solvable quantum models, enabling real-time decision-making at scale. It integrates predictive analytics, real-time inventory data, and SKU-level intelligence to recommend optimal item placements and picker routes, significantly reducing travel time, congestion, and operational costs. The system comprises four core components: a Quantum Optimization Core, Slotting-Picking Integration Module, Data Acquisition and Feedback Layer, and Warehouse System Interface. These modules work together to provide continuous self-optimization, adapting dynamically to changing order profiles, SKU behaviors, and physical layout constraints. The invention interfaces seamlessly with existing Warehouse Management Systems (WMS) and offers a user dashboard for monitoring, simulation, and control. By unifying slotting and picking processes under a quantum-enhanced framework, this invention delivers a scalable, intelligent, and adaptive solution for modern warehouses, capable of handling the growing complexity of e-commerce and high-throughput logistics environments.

(57) Abstract :  
Disclosed herein is a holonomic omni directional robot system (100) for nutritional deficiency detection through multi-spectral imaging in vertical farming, comprising a structural frame and chassis (102). The system (100) also comprising a housing (104) further comprising a processing unit (106), a holonomic drive unit (108) further including at least three stepper motors (116) mounted 120° apart, a camera unit (118) and a plurality of temperature and humidity sensor (120). The system (100) comprising a motor control assembly (110) further comprising a computer numerical control shield (124), and a stepper motor driver (126). The system (100) comprising an imaging module (112) configured to process the multispectral images captured from the camera unit (118). The system (100) comprising a mobile user interface (134) configured to provide real-time monitoring, control, and display of processed plant health imagery and operational status.

(57) Abstract :

Disclosed herein is a text mining and lyrics-based emotion classification system and method thereof (100) that comprises a lyrics dataset network (102), a real-time lyrics input network (104), and a keyboard lyrics entry unit (106) for collecting song lyrics, and a biometric sentiment input unit (108) for capturing physiological emotional responses. A communication network (110) transmits data to a preprocessing unit (112) comprising a lyrics data acquisition module (114), a text preprocessing module (116), a natural language toolkit integration module (118), a bag of words matrix generation module (120), a term frequency-inverse document frequency vectorization module (122), and a part-of-speech tagging module (124). A microcontroller (126) executes classification using feature extraction (128), training (130), tuning (132), validation (134), and visualization (136-142). Outputs are displayed via a graphical display unit (144), and stored in a central storage unit (152).

(57) Abstract :

With the rapid increase in power demand and the rising fuel costs at power generation stations, optimizing fuel expenditure has become a critical concern. To address this issue, machine learning models are employed to predict and optimize fuel costs effectively. This paper proposes a multi-linear regression approach for accurate fuel cost prediction based on historical data. For optimization, a Differential evaluation machine learning model is utilized, offering an efficient solution to the multi-objective optimization problem. Comparative analysis reveals that while traditional algorithms and Bees provide viable solutions, the Bat algorithm demonstrates superior efficiency in optimizing fuel cost in power systems.

(57) Abstract :

Disclosed herein is a system (100) and a method (1600) for detecting quantum-induced photothermal characteristics of a nanomaterial. The method (1600) comprises exciting an optical Fiber Bragg Gratings (FBG) photosensor (102), by a broadband excitation source (104), at an incident wavelength. The optical FBG photosensor (102) includes a plurality of FBG elements and a fluorescent photosensitive nanomaterial having photothermal conversion properties. InfraRed (IR) light is illuminated by an IR source (110) into the optical FBG photosensor (102). A photodetector (112) receives the IR light reflected by each FBG element of the plurality of FBG elements. A determination unit (118) determines a shift in a Bragg wavelength of the reflected IR light received by the photodetector (112). Photothermal characteristics of the optical FBG photosensor (102) are detected based on the shift in the Bragg wavelength and a change in the interference pattern of the Bragg wavelength of the reflected IR light. (Representative Figure: FIG. 1)

(57) Abstract :

THE EFFECTIVENESS OF IMPLEMENTING AN INFORMATION TECHNOLOGY RISK ASSESSMENT SYSTEM IN IMPROVING THE PERFORMANCE OF THE AI-MISK ORGANIZATION ABSTRACT The present invention discloses an adaptive Information Technology Risk Assessment System aimed at improving organizational performance in AI-centric enterprises like AI-Misk. The system uses machine learning algorithms, real-time monitoring, and risk impact modeling to identify and mitigate IT-related vulnerabilities across infrastructure and AI systems. Key components include automated risk scoring, predictive threat analytics, and governance alignment tools. Implementation of this system results in enhanced resilience, operational agility, and decision-making accuracy. It addresses the limitations of traditional risk methods by offering a scalable, intelligent, and responsive framework, ensuring proactive risk mitigation and sustained organizational growth.

(57) Abstract :

**MAGNETO-ELECTRO-MECHANICAL CHARACTERIZATION APPARATUS FOR MAGNETIC SAMPLES** The present invention provides an apparatus and a method for testing material property of a magnetic sample under a composite load. The apparatus comprises at least two load testing platform arrangements and a fixed base. Each load testing platform arrangement includes a movable part and a stationary part. The fixed base mounts the at least two load testing platform arrangements, and is configured to provide basic positioning and mechanical stability for the load testing platform arrangements. The load testing platform arrangements are configured to apply the composite load to the magnetic sample in a first direction and a second direction simultaneously, where the first direction and the second direction are mutually perpendicular to each other. Concurrently, the load testing platform arrangements are configured to precisely detect a load signal and a magnetoelectric voltage signal to realize a property of the test sample under the composite load. (57) Abstract :  
ARTIFICIAL INTELLIGENCE FOR ENVIRONMENTAL PROTECTION: OPPORTUNITIES AND CHALLENGES ABSTRACT This invention presents a novel Artificial Intelligence (AI)-driven framework for environmental protection that utilizes advanced algorithms to monitor, predict, and mitigate ecological threats. By integrating AI with environmental data sources such as satellite imagery, IoT sensors, and atmospheric models, the system enables real-time analysis of pollution, deforestation, climate change, and biodiversity loss. The AI engine is capable of anomaly detection, predictive modeling, and decision optimization, thereby enhancing proactive environmental management. Designed with modular architecture, the framework supports easy integration with existing infrastructure and ensures ethical compliance through explainable AI and privacy-aware protocols. It addresses both opportunities and challenges of deploying AI in environmental contexts, such as data scarcity, model interpretability, and algorithmic fairness. The invention provides scalable, intelligent solutions to empower environmental agencies, policy-makers, and communities in their efforts toward ecological conservation and sustainable development. It represents a forward-looking approach to combating environmental degradation through technology-driven innovation.

(57) Abstract :

Tiny yolo object detection using raspberry PI is the proposed invention. Wildlife conservation and human-wildlife conflict mitigation are critical concerns in forested and rural areas. This project proposes a Wildlife Detection and Alert System utilizing Tiny YOLO (You Only Look Once) on Raspberry Pi to detect animals in real-time and alert concerned authorities or individuals in proximity. The system leverages computer vision techniques and deep learning algorithms to identify wildlife species, helping in preventing human-wildlife conflicts, tracking endangered species, and monitoring biodiversity. The existing wildlife monitoring systems mostly rely on manual surveillance, motion sensors, or large-scale expensive camera networks. These systems face several challenges such as high costs, maintenance issues, and limited real-time detection capabilities. Our system addresses these limitations by utilizing a low-cost, energy- efficient embedded solution with edge AI processing, enabling real-time wildlife detection without dependency on cloud-based computations.

(57) Abstract :

Additive Manufacturing (AM) has emerged as a disruptive technology that is transforming the healthcare industry by enabling the production of complex, patient-specific medical products with a level of precision and customization previously unattainable using traditional manufacturing techniques. Its impact spans across patient care, rehabilitation, and overall treatment outcomes. AM supports rapid prototyping, facilitates iterative design modifications, and allows for adaptation to individual anatomical and functional requirements—ushering in a more patient-centered approach to medical product development. Leveraging these capabilities, healthcare providers and manufacturers can deliver personalized solutions that improve treatment effectiveness, comfort, and quality of life. This research investigates the influence of AM on lead time in healthcare supply chains, specifically in the context of manufacturing customized medical products. A comprehensive literature review was conducted to explore the necessity

(57) Abstract :

Many individuals with speech or hearing impairments face significant barriers when it comes to effective communication, particularly in digital and remote settings. Traditional video conferencing tools and assistive technologies often lack real-time, gesture-based communication support, limiting inclusivity and accessibility. The Astra project addresses this challenge by offering a real-time gesture recognition system that seamlessly translates hand movements into both text and speech outputs. This system enables intuitive and instant communication, removing dependency on spoken language or external devices. With a user-friendly interface and responsive design, Astra operates smoothly across multiple platforms and devices, providing an inclusive communication channel for users with diverse needs. Astra stands out with its unique dual output mode, delivering both text and synthesized speech to accommodate diverse communication needs. Optimized for real-time gesture detection and response, it ensures a seamless, natural conversation experience. Its platform-agnostic and modular design allows effortless integration with any web-based platform, enhancing digital accessibility without dependence on specific conferencing tools. As an open- source solution, Astra fosters transparency and invites innovation in inclusive technology. Most importantly, it empowers individuals with speech and hearing impairments by offering an accessible communication alternative, promoting equal participation in virtual environments and functioning effectively even in noise-sensitive or silent settings.

(57) Abstract :

The system (100) includes a raw material feeding unit (102), a pre-treatment unit (104), a pyrolysis chamber (106), an activation unit (108), a cooling unit (110), a crushing and sieving unit (112), a storage unit (114), a methylene blue absorption analysis unit (116), and a control unit (118). The raw material feeding unit (102) is configured to feed agro waste into the pre-treatment unit (104) in a regulated manner. The pre-treatment unit (104) is adapted to clean and dry the agro waste to remove moisture and impurities. The pyrolysis chamber (106) is configured to thermally decompose the dried agro waste under limited oxygen to form char. The activation unit (108) utilizes steam or chemical agents at elevated temperatures to activate the char and develop porosity. The cooling unit (110) reduces the temperature of activated carbon to ambient level post activation.

(57) Abstract :

Abstract- By integrating state-of-the-art technology, the "Smart Soil Nutrient Mapping System Using AI and IoT" provides a new approach to precision farming with the aim of revolutionizing traditional soil testing. The system employs an IoT-sensing network complemented by AI-driven data analytics to provide real-time location-based soil nutrient information. It enables farmers and agricultural specialists to dynamically monitor and manage soil fertility, which optimizes crop growth, minimizes fertilizer overuse, and enhances sustainable agriculture practices. Traditional methods of soil nutrient analysis often involve laboratory analysis and manual sampling, which are time-consuming, labor-intensive, and unsuitable for large agricultural fields. This concept, however, puts intelligent, wireless sensor nodes along the field to collect data constantly on important factors such as pH, moisture, temperature, electrical conductivity, phosphorus (P), potassium (K), and nitrogen (N) of soil. The sensors employ secure Internet of Things connection protocols, to transfer data to a centralized cloud platform.

(57) Abstract :

Abstract-Employing the combined strengths of artificial intelligence (AI) and Internet of Things (IoT), the present invention is an intelligent climate management system designed particularly for warehouses. Pharmaceuticals, sensitive electronics, perishable products, and materials requiring special climatic conditions for safe storage are just some of the numerous products that are commonly stored in warehouses. Traditional climatic control systems rely on manual intervention or programmed schedules, often leading to wasteful use of energy and product deterioration as they respond slow or unsuitably to environmental changes. This innovation puts forward a dynamic, data-driven, real-time system that constantly senses and smartly regulates warehouse climatic conditions. Temperature, humidity, CO levels, air quality, light intensity, and particle matter are all tracked by the system's scattered network of Internet of Things-enabled environmental sensors placed intelligently throughout the warehouse. A library of AI algorithms trained on previous climatic conditions, product-specific storage requirements, and energy efficiency prediction models and product integrity preservation is contained within a central processing unit that takes in sensor data wirelessly transmitted. Upon analysis, the AI engine generates control signals for actuators that are mounted on exhaust fans, dehumidifiers, HVAC units, and other environmental control devices. The internal climate is automatically regulated through these actuators. The AI models continue to learn in order to grow productivity and prediction accuracy in the long run, and the system contains a feedback loop to ensure that the changes have the desired effect. Additionally, warehouse managers may view historical and current climate data, receive alerts, and override the AI control when needed thanks to the invention's cloud-based dashboard, which is available via online and smartphone interfaces. By seeing early indicators of temperature control equipment failure and alerting users beforehand, the system .also provides predictive maintenance capabilities. Therefore, the proposed AI-IoT hybrid system presents a comprehensive, scalable, dynamic, and highly adaptive intelligent solution for warehouse climate control. Product safety is considerably increased, human intervention is reduced, energy efficiency is improved, and some level of automation and intelligence that was not possible before using conventional systems is brought about by the invention.

(57) Abstract :

Milk spillage during boiling is a common issue in Indian households, leading to wastage, safety hazards, and additional cleaning efforts. Manual supervision is often required, making the process inefficient and timeconsuming. Existing solutions lack automation, requiring continuous monitoring to prevent overboiling and spillage. This invention provides an automated system to prevent milk from boiling over and spilling by utilizing pneumatic actuators, temperature sensors, and liquid sensors. The system is designed to detect critical - boiling conditions and -lift the milk vessel, preventing overflow and reducing milk wastage. An ESP32 microcontroller processes real-time data from the sensors and activates the actuators when necessary. Additionally, a beeper alert system notifies users before the vessel is lifted, ensuring an extra layer of intervention. The device is powered by a compact 12V Tadiran heat-resistant battery, ensuring wireless operation and energy efficiency. Future improvements include the integration of a thermistor to absorb heat from the stove flame, which will enhance temperature monitoring and reduce external power dependency. Key features include an automated spill prevention mechanism, real-time monitoring with temperature and liquid sensors, ESP32 microcontroller-controlled operation, a beeper alert system for user notification, and a heat-resistant battery for reliable power, making the system highly efficient, safe, and hassle-free for household and commercial kitchens.

(57) Abstract :

This invention introduces Ecowatt, a smart platform that helps users reduce electricity costs and manage power consumption more efficiently. It combines artificial intelligence (AI) with IoT-based device control to monitor energy usage in real time, especially for homes or businesses that use both grid and renewable sources like solar power. A key feature of Ecowatt is its ability to automatically pre-schedule the use of electrical appliances based on real-time electricity pricing (Time-of-Use tariffs), forecasted energy needs, and available solar energy. The system uses AI models to analyze past consumption patterns and predict optimal times to run high-energy devices such as washing machines or air conditioners. With the help of IoT sensors, Ecowatt keeps track of how and when appliances are used. It also includes a module that balances solar and grid usage smartly to reduce dependency on the grid when solar power is available. The platform offers users a visual dashboard with energysaving tips, alerts, and insights, making energy management simple and sustainable.

(57) Abstract :

The proposed invention relates to development of High-Power Ku-Band WR-75 Waveguide Load using Room Temperature Vulcanized (RTV) Silicon Adhesive Material, which is normally used as adhesive/bonding material for solar panels onboard the spacecrafts and is found to be a good absorbing material at microwave frequencies, especially at Ku-band frequency in the ranges from 10 GHz to 15 GHz, where its dissipation factor (or loss tangent) is quite high. More specifically, the present invention relates to development of a high-power waveguide attenuator and high-power waveguide loads at Ku-band and high-power waveguide loads, attenuators at ka-band frequency also. ABSTRACT OF THE INVENTION: 240 245 250 255 260 Title: System and Method for AI-Driven Dynamic Pricing to Reduce Food Waste in Retail Environments  
The invention relates to an AI-powered system for optimizing the pricing of perishable goods in supermarkets to minimize food waste and enhance profitability. The system comprises modules for real-time data collection, freshness evaluation, and machine learning-based pricing adjustment. It dynamically alters prices based on shelf life, demand, inventory levels, and competitor pricing while ensuring transparency and customer trust. The system also includes a feedback loop for continuous AI retraining based on actual waste outcomes, thereby contributing to sustainable retail operations.

## (57) Abstract :

In most parts of the world, particularly in rural and under-resourced regions, medical systems face numerous challenges including inadequate medical staffing, limited access to specialized healthcare, long wait times, and misdiagnosis due to overwhelming workloads. "Dr. Curion" is a comprehensive Artificial Intelligence (AI)-powered healthcare assistant developed to overcome these barriers by combining deep learning and Natural Language Processing (NLP) to provide accessible and accurate preliminary medical diagnoses. The invention comprises two primary AI models: 1. A deep convolutional neural network (CNN) trained to analyze chest Xray images and diagnose pneumonia with high accuracy. 2. An NLP model trained to interpret and process patient-reported symptoms entered in natural language. It outputs a detailed medical report with probable diagnoses, drug recommendations based on Indian pharmacopoeia, and basic health advice. The system maintains a digital patient record, reduces diagnostic delays, and can be accessed via web interfaces, mobile apps, or integrated with hospital systems. It is designed to scale by adding new disease classifiers and multilingual support for broader reach in India and similar regions

(57) Abstract :

Abstract This project outlines the design and creation of a Bluetooth-operated electric cultivator intended to improve agricultural productivity through automation and remote control capabilities. Conventional soil cultivation techniques typically involve considerable manual effort and the use of fuel-driven machinery, which can be labor-intensive and detrimental to the environment. The suggested system offers a sustainable, electric- powered cultivator that can be managed wirelessly through a smartphone application utilizing Bluetooth technology. The primary elements consist of a cultivator blade mechanism powered by a DC motor, a microcontroller (like Arduino or ESP32), a motor driver, and a Bluetooth module (HC-05/HC-06). This system facilitates real-time control over movement and functionality, enabling users to operate the cultivator remotely with ease. Such a method greatly minimizes manual labor and enhances accuracy in small-scale agricultural and gardening activities. Furthermore, the electric power supply guarantees quieter operation and eliminates emissions, thereby supporting sustainable farming practices.

(57) Abstract :

**ABSTRACT A BLUETOOTH AUSCULTATION SYSTEM FOR EARLY DETECTION OF CONGENITAL HEART DISEASE OF CHILDREN** The present invention discloses a Bluetooth auscultation system (10) for early detection of congenital heart disease in offline condition. The system comprises a MEMS microphone is configured to capture low frequency heart sounds for detecting the heart murmurs and other. The signal conditioning unit (13) houses the low noise amplifiers and analog filters to pre-process the raw heart sounds before digitalization. The analog to digital converter is configured to convert analog heart sound signals into digital data for data transmission and processing. The BLE module (15) is configured to enable wireless transmission of digitized heart sound signals to one or more paired android devices. The data acquisition module is configured to capture raw heart sound signals from the Bluetooth low energy module and transmit it to the processing platform. The pre-processing module (18) is configured to prepare raw audio data for the classification by enhancing signal quality and extracting meaningful features. The classification module is configured to analyse the pediatric heart sound using the plurality of convolution layers. The post processing module comprises a threshold calibration module and a confidence scoring module. The interface module (21) is configured to serve as the user interaction and processing platform by means of receiving, analysing and displaying heart sound data. The present invention (10) eliminates the need of medical workers to check the heart diseases in remote areas and emergency situations. Fig 1

(57) Abstract :

Abstract This solar-powered animal repellent system offers an eco-friendly and humane solution to deter unwanted animals from gardens, farms, and properties. Harnessing solar energy, the system emits ultrasonic frequencies and flashing LED lights to create an unpleasant environment for pests, effectively repelling them without causing harm. With its weather-resistant design and adjustable settings, this system provides a reliable and customizable solution for protecting crops and property from animal damage, promoting a safe and sustainable coexistence between humans and wildlife.

## (57) Abstract :

The isolation of berberine from Berberis aristata and its molecular docking analysis introduces a promising strategy for advancing anti-diabetic therapeutics through natural plant-based compounds. Berberine, a potent iso-quinoline alkaloid, is widely recognized for its hypoglycemic effects, primarily through its interaction with key metabolic enzymes. The compound is extracted using methanolic Soxhlet extraction and further purified and characterized to ensure high bioactive integrity. Molecular docking studies reveal that berberine exhibits significant binding affinities to enzymes such as  $\alpha$ -glucosidase and hexokinase, which are critically involved in glucose metabolism and insulin sensitivity. These enzyme interactions suggest berberine's potential to regulate postprandial glucose levels, enhance glucose uptake, and improve insulin signaling pathways. This research highlights the compound's ability to serve as a multi-targeted therapeutic agent, offering a safer and more natural alternative to conventional synthetic drugs. By integrating traditional phytochemical techniques with computational drug discovery tools, this approach supports the development of novel anti-diabetic formulations that are both effective and biocompatible, contributing to more holistic diabetes management.

(57) Abstract :

029] The present invention discloses a self-learning robotic control system utilizing adaptive neural network architectures for real-time decision-making and task execution. The system comprises a sensor interface for acquiring environmental and internal state data, a neural learning engine for processing inputs and generating control commands, an actuator interface for executing said commands, a reward evaluation module for continuous feedback based on performance, and a dynamic architecture controller capable of modifying the neural network's structure in response to operational conditions. Unlike traditional robotic systems with fixed models, this invention supports real-time structural evolution of the neural network, enabling autonomous optimization of both network topology and learning parameters. The system also supports modular learning subcomponents for subtasks such as perception, navigation, and manipulation, and includes a simulation sandbox for validating models before real-world deployment. The invention facilitates lifelong learning, enhanced autonomy, and improved adaptability across diverse environments, offering a scalable and intelligent solution for next-generation robotic systems. (57) Abstract :

Abstract Traditional manual seed sowing methods are labor-intensive, time-consuming, and often lead to issues such as uneven seed distribution, inconsistent depth, and unnecessary wastage. Addressing these challenges is crucial for enhancing agricultural efficiency, especially in the context of small and medium-scale farming. This project presents the design and fabrication of an Automated Seed Sowing Machine aimed at improving sowing accuracy, reducing human effort, and promoting sustainable agricultural practices. The developed machine features a motor-driven seed metering mechanism, enabling precise seed dispensing and uniform sowing. An integrated system allows for adjustable seed spacing and sowing depth, catering to various crop requirements. The machine is built on a lightweight, durable chassis designed for easy handling, mobility, and operation across different terrains and soil types. Key features include: • Interchangeable seed plates to support multiple crop varieties. • User-friendly control system for easy operation and configuration. • Cost-effective and energy-efficient design, suitable for small and medium-sized farms. • Low-maintenance architecture, making it practical for long-term rural use. By automating critical aspects of the sowing process, the machine ensures optimal seed placement, enhances germination rates, and contributes to improved crop yields. Ultimately, this solution supports the shift toward mechanized and sustainable farming, reducing dependency on manual labor and improving agricultural productivity

(57) Abstract :  
ABSTRACT Title: System and Method for Sparse Matrix Factorization Using Reinforcement Learning for Large-Scale Recommender Systems 380 385 390 395 400 405 The present invention introduces a novel hybrid recommender system architecture that synergistically combines reinforcement learning (RL) with sparse matrix factorization to significantly enhance the performance and adaptability of recommendation engines in large scale and dynamic data environments. Traditional recommendation approaches that rely solely on matrix factorization often struggle to deliver optimal results in scenarios characterized by high levels of data sparsity or rapid shifts in user preferences. By integrating reinforcement learning into the matrix factorization process, the invention overcomes these limitations and delivers intelligent, context-aware recommendations. At the core of the invention is a policy-driven reinforcement learning agent that learns to make informed updates to the latent vectors representing users and items in a sparse matrix. These latent vectors are critical in capturing the underlying structure of user-item interactions. Unlike conventional systems that rely on static optimization techniques, the proposed agent uses feedback-derived reward signals—such as clicks, ratings, dwell time, or engagement rates—to guide its decision-making process. Each action taken by the agent corresponds to an update in the latent feature space, with the objective of minimizing prediction error and maximizing user satisfaction. The system continuously monitors incoming feedback and adapts the recommendation strategy in real time. Through deep reinforcement learning models, such as Deep Q-Networks (DQN) or Proximal Policy Optimization (PPO), the policy network evolves to improve its performance in diverse user scenarios. The inclusion of both explicit and implicit feedback ensures that the model is sensitive to nuanced patterns in user behavior, leading to more accurate and relevant content delivery. Furthermore, the invention is designed to function effectively even under extreme sparsity conditions, such as those involving new users (cold start) or rarely rated items. By leveraging the decision-making capabilities of reinforcement learning, the system dynamically explores latent feature adjustments that conventional factorization algorithms may overlook. This results in higher personalization, better generalization, and greater robustness across a variety of recommendation use cases. 13 410 In summary, the invention represents a significant advancement in the field of intelligent recommendation systems. By fusing the structured learning capability of matrix factorization with the adaptive, feedback-driven intelligence of reinforcement learning, it establishes a powerful framework capable of delivering scalable, accurate, and personalized recommendations in real-world, data-intensive environments.

(57) Abstract :

ABSTRACT PREPARATION OF GRAPHITIC-CARBON-NITRIDE (g-C3N4)/RUST/PVDF NANOCOMPOSITE FOAM AND THEIR APPLICATIONS THEREOF FOR OIL/WATER SEPARATION The present invention provides a method for the preparation of graphitic-carbon-nitride (g-C3N4)/Rust/PVDF nanocomposite foam comprising the following steps: (a) transferring a melamine precursor to a receiver and calcinating said precursor, (b) cooling down the product to ambient temperature, collecting the same, and grinding it to a fine powder, (c) sieving the rust so obtained from step b) to remove debris, washing the same suitably and drying it, (d) subjecting the product obtained from step (c) to further calcination to obtain  $\alpha$ -Fe2O3, (e) mixing calcinated rust, g-C3N4, PVDF powder, and table salt and heating the mixture, (f) subjecting the heated mixture to hot water for a prolonged period till obtaining template-free graphitic-carbon-nitride (g-C3N4)/Rust/PVDF nanocomposite foam. A graphitic-carbon-nitride (g-C3N4)/Rust/PVDF nanocomposite foam with enhanced traits is also disclosed. FIG. 3

(57) Abstract :

This work evaluates the usefulness of image analysis to describe the stages of agricultural product drying, with the aim of optimizing the process and improving final product quality. Using a laboratory-scale dryer, continuous digital image capture was performed through a small double-glazed window. Other variables of the drying process were monitored, including changes in air temperature and humidity, and product weight. The HSV color model was used for image analysis, and the average value and standard deviation of the hue (H), saturation (S), and brightness (V) channels of a cropped image were tracked over time to correlate them with variations in product texture. The Scilab programming language and its SIVP image processing tool were used for this purpose. Two loads of Virginia tobacco and two loads of paprika were dried. Based on these experiments, it was determined that the average value of H and its standard deviation are good indicators of the evolution of the drying process for these agricultural products. Further experiments are still needed to clearly define the benefits of using it as a control and optimization tool. If confirmed, its potential would lie not only in a qualitative improvement of dried products but also in a more efficient use of energy resources. (57) Abstract :

A steering arm for a heavy-duty vehicle [0026] The present invention relates to a steering arm (101) for a heavy-duty vehicle. The steering arm (101) comprises a first end (201) with a rectangular cross-section and a through-hole (202) for connection to a ball stud of a drag link, and a second end (203) adapted to connect to a steering knuckle (102). The second end (203) is having a T-shaped cross-section with a laterally extending top flange (204) matching the width of the steering knuckle (102). The steering arm (101) comprises a main body (206) that connects the first and second ends, transitioning from the rectangular to the T-shaped profile. The top flange (204) is having mounting holes (205) to receive bolts for attachment. The steering arm (101) reduces stress concentrations and improves load distribution across the steering knuckle (102). (Figure 2)

(57) Abstract :  
Disclosed herein is an Internet of Things (IoT)-based automated patrolling system (100) and method (200) for detecting vehicles in unauthorized parking areas. The system (100) includes a patrolling unit (102) that comprises a location detection unit (104) and a camera (106) for capturing geographic coordinates and real-time video evidence. An edge processing unit (108) on the patrolling unit (102) includes a data input module (110), a data processing module (112), a violation verification module (114), and a communication module (116) to transmit verified violation data via a communication network (118) to a data center (126). The processing unit (128) comprising violation input module (130), a violation data processing module (132), a number plate detection module (134), an optical character recognition (OCR) module (136), a validation module (138), a fine issuance module (140), a notification module (142), and an output module (144). The system (100) also includes a user device (122) with a user interface (124).

(57) Abstract :

ABSTRACT: Title: Waste Plastic–Reinforced Structural Brick with Interlocking Geometry for Low–Cost Housing A new type of brick, made from plastic waste and different fillers, is described and its design with precise interlocking edges allows units to interlock, without cement mortar. Using bricks enhances the building’s ability to bear weight, insulate from heat and maintain its shape and also lowers the environmental impact. The linking system guarantees all walls are aligned and look the same which makes it useful for low-priced, quick and sustainable homes. Because it recycles plastic waste into useful materials, this invention supports circular economy in the construction industry.

(57) Abstract :  
ABSTRACT: Title: Gamified Error Detection Engine for English Sentence Correction The invention provides a gamified digital learning platform for English sentence correction, designed to improve grammar skills through interactive engagement. The system generates sentences with deliberate grammatical, punctuation, or syntactical errors and allows learners to identify and correct them via an intuitive interface. Using drag-and-drop features, typing, or selection tools, users modify the sentence and receive real-time feedback. The feedback engine offers explanations, grammar rules, and examples to reinforce learning. A scoring and reward system promotes user motivation, while adaptive difficulty ensures personalized learning paths. The platform supports classroom integration, educator customization, and individual self-paced learning. It offers cloud-based progress tracking, secure data storage, and scalable modules for additional grammar topics or language expansions. This invention enhances traditional language education by fostering active participation, critical thinking, and mastery of grammar in a game-like environment.

(57) Abstract :  
The present disclosure relates to a micro-hardness testing system (102) and method (500) for predicting vickers hardness number (VHN) of metal matrix composites (MMCs). The system (102) includes a micro-hardness tester (222) and a digital interface (224). The micro-hardness tester (222) is configured to measure a VHN of MMC samples up to a predefined reinforcement percentage (X%). The digital interface (224) is configured to display measured and predicted VHN results in real-time. VHN is measured up to a predefined reinforcement level (X%). Machine learning models selected from ten algorithmic baskets are trained using VHN data. The models are evaluated using Mean Squared Error (MSE), Root Mean Squared Error (RMSE), and R-squared (R²). The best-performing models are selected and a stacking method is applied. VHN values are predicted for MMCs with reinforcement levels beyond said X%, and displaying the predicted VHN on the digital interface (224).

(57) Abstract :

The present disclosure relates to a Fast Fourier Transform (FFT) processor comprising a plurality of butterfly units (202) configurable in three operational modes. A Type 1 butterfly processes two input samples using a pair of adders. A Type 2 butterfly processes three input samples and one real twiddle coefficient using a delay module (106) providing 1-cycle and 2-cycle delays, a real multiplier, and multiple adders. A Type 3 butterfly processes two real input samples and a pair of complex twiddle coefficients using multiple real multipliers and adders. A control unit (110) dynamically selects the butterfly mode based on the FFT stage. A twiddle factor generator (118) provides real and complex coefficients to the second and third modes, respectively. A memory unit (108) supports in-place addressing for input-output storage. A pipelined architecture with pipeline registers (112) enables stage-wise parallelism. The processor further includes a floating-point arithmetic unit (114) supporting 32-bit single-precision operations and a Vedic multiplier unit (116) for efficient multiplication.

(57) Abstract :

An apparatus (100) for generating electricity from waste heat generated in chimneys is provided. The apparatus (100) involves a heat extracting unit (102) configured to increase heat extraction from chimney. The apparatus (100) also involves one or more thermoelectric generator (TEG) modules (112) to receive heat from the chimney and convert to electric energy due to temperature gradient between a hot side (110) and a cold side (114) of the one or more TEG modules (112) based on a Seebeck effect. The apparatus (100) is modular, allowing easy installation on existing chimneys, wood stoves, or LPG units. The apparatus (100) also includes a flue gas filtration unit (124) to remove particulate matter and toxic gases like nitrogen and sulfur oxides, improving air quality. The generated electricity is stored in a rechargeable battery (120), providing a reliable power source. The invention offers a sustainable, cost-effective solution for rural energy needs, promoting cleaner air and efficient energy use.

(57) Abstract :

A system 100 to produce electric energy from leaf-type suspension assembly 102 of a vehicle includes a first set of leaf springs 104 coated with a first triboelectric material; and a second set of leaf springs 106 coated with a second triboelectric material. The one leaf spring from the first set of leaf-springs 104 is placed above one leaf spring from the second set of leaf-springs 106 to form a pair of leafs and such pairs are staked to form the suspension assembly 102 such that when the vehicle moves with the assembled suspension assembly 102 over uneven terrain or carries varying loads, mechanical vibrations generates to causes the first leaf 104 and the second leaf 106 with different triboelectric materials slides against each other to transfer electrons and creating triboelectric charge, which is collected and stored for applications.

(57) Abstract :

Abstract A Non-Invasive Multi-Parametric Optical Device for Real-Time Blood Analysis Using Arduino-Based Processing Purpose: This invention aims to develop a non-invasive, real-time diagnostic device capable of estimating key blood parameters—hemoglobin, red blood cells, white blood cells, and platelets—without the need for blood extraction. Methodology: The device uses an optical sensing module based on near-infrared light sources and photodetectors, integrated with a microcontroller for signal processing. As the user places a fingertip on the sensor, light absorption patterns from capillary blood are detected and processed. Embedded algorithms interpret the data and output physiological estimates on a display. Machine learning models are used to calibrate and improve the accuracy of predictions. Results: Testing on multiple human subjects demonstrated that the device can estimate all four blood parameters with high accuracy, consistently maintaining a deviation of less than  $\pm 5\%$  compared to standard laboratory results. Real-time values are displayed on an LCD screen, with audible alerts for abnormal readings. Conclusions: The proposed system offers a compact, user-friendly, and non-invasive solution for blood analysis. It reduces the need for invasive procedures and laboratory infrastructure, making it especially valuable in remote and resource-limited settings. This innovation supports rapid screening and continuous monitoring, enhancing patient comfort and expanding access to essential diagnostics.

(57) Abstract :

Agricultural post-harvest losses remain a significant global challenge, with millions of tons of produce wasted annually due to inefficient storage, poor climate control, and lack of real-time monitoring. Farmers, especially in rural and developing regions, face economic losses due to the unavailability of cost-effective storage solutions. Preserva is a cutting-edge Sustainable and Smart Agro Storage system designed to tackle this issue by integrating Internet of Things (IoT), Artificial Intelligence (AI), and Renewable Energy. The core objective of Preserva is to enhance food security, minimize wastage, and optimize storage conditions for agricultural produce. The system leverages a network of environmental sensors to monitor temperature, humidity, gas composition (ethylene), and moisture levels in real-time. To ensure sustainability and energy efficiency, Preserva is powered by solar panels and energy-efficient cooling mechanisms, reducing reliance on traditional electricity sources. The storage unit is designed to be scalable and cost-effective, catering to small-scale farmers as well as large agricultural enterprises. With wireless connectivity options such as Wi-Fi, farmers can monitor the storage unit through their smartphones or computers. The implementation of Preserva is expected to significantly reduce post-harvest losses, increase economic stability for farmers, and promote sustainable agricultural practices. Future enhancements to the system include blockchain-based inventory tracking, AI-driven market insights, and automated pest control mechanisms. By harnessing modern technology and renewable energy, Preserva presents a transformative solution for the agricultural sector, ensuring efficient, sustainable, and intelligent food storage that benefits both farmers and consumers alike.

(57) Abstract :  
An artificial intelligence (AI)-driven consumer trust bias mitigation system, comprising a bias-free adaptive recommendation module 101, which includes multiple explainable AI (XAI) models for generating transparent justifications for each recommendation to a user and a diversity-aware AI model for ensuring fair content and product suggestions to the user, a trust-based consumer interaction module 102, which includes trustworthiness score generation for evaluating AI-driven personalization based on ethical fairness metrics and Block chain-backed data transparency for storing AI decision logs on a decentralized ledger for verifiability, a multimodal consumer sentiment analysis module 103, which employs emotion-aware sentiment processing, automated trust-driven user interface (UI) adjustments for adapting recommendation style, an adaptive ethical decision module 104, which includes generation of a bias sensitivity index (BSI) for constantly assessing the risk of biased personalization, adaptive ethical filtering and real-time regulatory compliance monitoring: Aligns AI recommendations with GDPR, CPRA, and Indian Data Protection Laws.

(57) Abstract :

A neuro-symbolic cognitive system comprises of an adaptive neuro-symbolic trust optimization module that employs multi-layer trust modelling for integrating historical AI accuracy, real-time feedback and behavioral analysis and generation of explainability-driven confidence thresholds for ensuring high-risk AI decisions require human validation, a cognitive load-aware AI task allocation module that includes a cognitive workload prediction model employing neural embeddings and knowledge graphs to anticipate task complexity, a neuro-symbolic AI decision proxy for allocating tasks between AI-only, human-assisted AI and human-only workflows, an explainable neuro-symbolic reasoning module employs hybrid neural G symbolic interpretability engine to provide a step-by-step logical reasoning for AI-generated outputs, a multimodal visualization dashboard for showing human-comprehensible justifications for AI decisions, a self-optimizing human-AI synergy module employs human intent understanding model for contextual analysis of queries of the user, task performance benchmarking for evaluating efficiency, accuracy, and cognitive effort of the user in hybrid AI-human workflows.

(57) Abstract :

ABSTRACT A PHARMACEUTICAL COMPOSITION HAVING MECLIZINE FOR TREATING TUBERCULOSIS, AND METHODS THEREOF The present disclosure provides a pharmaceutical composition comprising: 5 (a) Meclizine; and (b) at least one anti-tuberculosis drug. The present disclosure also provides Meclizine for use in treating Tuberculosis, or symptoms thereof, in a subject. Further, the present disclosure provides a combination comprising Meclizine and at least one anti-tuberculosis drug. Furthermore, the present disclosure also provides a method for 10 reprogramming metabolism in Mycobacterium infected macrophage, the method comprising: contacting macrophages with the pharmaceutical composition as disclosed herein. Additionally, the present disclosure provides a method of treating tuberculosis and a kit thereof.

(57) Abstract :

ABSTRACT BIO-INSPIRED WHALE FLIPPER This invention relates to a bio-inspired rocket control system utilizing sinusoidal tubercles on aerodynamic fins to enhance flight stability and maneuverability. The fins incorporate mathematically defined sinusoidal tubercles along the leading edge, which generate streamwise vortices that energize the boundary layer, delay flow separation, and improve lift-to-drag ratio at high angles of attack. The system includes independently controlled servo motors for three-axis attitude adjustments, optimized for a broad range of Reynolds numbers. The fins are fabricated from lightweight composite materials with a smooth surface finish to promote laminar flow. This passive vortex generation provides energy-efficient control, reduces stall risk, and extends operational envelope, making it suitable for low-power rockets, UAVs, and marine applications. The invention offers scalable, retrofit-ready solutions with enhanced aerodynamic performance, durability, and control authority. Fig. 1

(57) Abstract :

This study evaluates the effectiveness of eggshell biochar, a low-cost and eco-friendly adsorbent, for removing fluoride ions from wastewater. The biochar was produced through pyrolysis of eggshell waste and its adsorption performance was investigated. Key parameters, including initial fluoride concentration, adsorbent dosage, solution pH, and contact time, were examined for their impact on adsorption efficiency. The Langmuir, Freundlich, and Temkin isotherm models were applied to understand the adsorption mechanism, with the Langmuir model providing the best fit and yielding a maximum adsorption capacity of 522.31 mg/g for fluoride ions (120 min contact time, 150 rpm agitation speed). The adsorption process was influenced by solution pH, electrostatic interactions, physisorption, and pore-filling, with functional groups (C=O, –COOH, –OH) on the eggshell biochar playing a crucial role. The Langmuir model outperformed other isotherm models, and the pseudo-second-order kinetics model accurately described the adsorption process. The findings suggest that waste eggshell-derived biochar holds promise as a sustainable adsorbent for water purification applications, particularly for fluoride removal.

## (57) Abstract :

The present invention provides a topical pharmaceutical hydrogel composition comprising Acyclovir, intended for the treatment of viral skin infections such as herpes simplex. The composition includes Acyclovir as the active pharmaceutical ingredient in a pharmaceutically acceptable hydrogel base containing one or more gelling agents, humectants, penetration enhancers, preservatives, and pH-adjusting agents. The hydrogel offers improved skin permeability, sustained drug release, enhanced stability, and better patient compliance due to its non-greasy, easily spreadable nature. The invention also discloses a novel and efficient process for the preparation of the hydrogel composition, which involves uniform dispersion of ingredients, controlled pH adjustment, and homogenization under specific temperature and mixing conditions. The resulting formulation ensures optimal drug delivery, prolonged residence time on the skin, and enhanced therapeutic efficacy. This invention addresses limitations associated with conventional topical Acyclovir formulations, such as poor skin penetration and limited bioavailability.

(57) Abstract :

ABSTRACT OF THE INVENTION: Title: Real-Time Badminton Action Recognition Based on MediaPipe and Motion-BERT The invention relates to a real-time action recognition system for badminton that utilizes pose estimation and bidirectional motion encoding. The system comprises a pose extraction engine using MediaPipe, a Motion Bidirectional Encoder Representation Transformer (Motion BERT) for understanding motion across time, and a classification module to predict badminton-specific actions. The invention provides low-latency, accurate, and efficient recognition of athletic movements for use in coaching, live annotation, and performance monitoring applications.

(57) Abstract :

ABSTRACT AN INSTANT AND PORTABLE WATER HEATING DEVICE AND A METHOD THEREOF The present disclosure discloses an instant and portable water heating device and a method thereof. The system (100) comprises a plastic molded outer casing (102) housing a power supply unit (104), an inlet chamber (106) with a water level sensor (110), and a heating element (114) embedded in a thermally conductive aluminum housing (116) filled with quartz sand and mineral oil for efficient heat transfer and retention. Cold water enters through an inlet nozzle (108), is rapidly heated in the inlet chamber (106), and flows into an outlet chamber (118) before being dispensed via a water tap (120) at the wash basin outlet (122). A flow sensor (124) monitors real-time water flow and deactivates the heating element (114) when no flow is detected, ensuring safety and energy efficiency. The sequential operation of sensors and heating components guarantees rapid, safe, and controlled delivery of hot water in a compact, user-friendly device.

(57) Abstract :

The present invention relates to a system and method for providing personalized, clinically reliable pregnancy-related information through a conversational chatbot platform powered by Retrieval-Augmented Generation (RAG) architecture. The system comprises a user interface for receiving natural language queries from pregnant individuals, a semantic query processor for intent classification and normalization, a retrieval engine configured to fetch medically authoritative content from structured and unstructured pregnancy-specific knowledge sources, and a transformer-based language model that generates contextual responses based on both the user input and retrieved content. The system provides evidence-linked outputs, and ensures safe guidance across all pregnancy stages. The invention improves upon existing chatbots by delivering personalized, evidence-based, and trimester-sensitive pregnancy support with clinical awareness.

(57) Abstract :

The invention discloses portable, one touch seat cover which provides 360° protection to two-wheeler seat from the sunlight and the rain. The cover consists of a U-shaped enclosure (1), plurality of thermal radiation insulating and waterproof sheets (2), plurality of sheet rollers (3), plurality of circular springs (4), plurality of roller holding rods (5), a lock button (6), plurality of L-shaped support rods (7), a U-shaped cover for the U-shaped enclosure (8), a pull tab on the U shaped cover for the U-shaped enclosure (9), plurality of connecting rods (10), plurality of sliding mechanism (11), a thermal radiation insulating and waterproof sheet (12), a mounting clamp (13). The variable length of cover which can be operated with one touch and retains its shape at any length extraction ensuring 360° protection against sunlight and rain to two-wheeler seat and fuel tank.

(57) Abstract :

System and Method for Real-Time Vehicle Collision Detection and Location-Based Alert Transmission The present invention relates to a system and method for automatic vehicle accident detection and emergency alerting. The system comprises a plurality of sensors configured to detect sudden impacts or collisions in a vehicle. Upon detection of an accident, a microcontroller processes sensor signals and activates a GPS module to obtain real-time location coordinates of the vehicle. A GSM module is subsequently triggered to send an automated alert message containing location details to pre-configured emergency contacts. The system is designed to enable rapid response from emergency services, thereby potentially reducing fatalities and injuries resulting from vehicular accidents. The invention is cost-effective, energy-efficient, and suitable for integration into various types of vehicles, facilitating real-world deployment in diverse environments.

(57) Abstract :

The independent six-legged robot is a huge step forward in robotics technology. It uses advanced materials, sensors, and AI algorithms to make a robotic system that can do a lot of different things and adapt to different situations. This robot is going to change many fields, like search and rescue, research, and industrial automation. It can move through complicated terrain, adapt to changes in its surroundings, and make decisions on its own using real-time data. The robot's ability to work alone in uncertain settings means that it can do important jobs without help from a person, which increases safety and efficiency. This project looks into how this robot was designed and built, looking at important parts like tests, software systems, hardware setup, and sensor integration. The robot is able to work in tough environments like disaster zones, rough terrain, or remote research sites because it uses advanced sensor technologies like LIDAR and computer vision, as well as complex motion mechanisms. Because it is independent, it can make decisions in real time and change its actions and jobs based on what is going on around it. This robot can be used for a lot of different things, such as saving lives in disaster-stricken areas, exploring the environment from afar, like on planets or underground, and automating jobs in factories. A lot of different businesses can benefit from using it because it can do complicated tasks on its own in places that are dangerous, hard to get to, or not good for human help. This project shows how combining hardware, software, and sensing technologies can let robots work independently, adaptably, and intelligently in changing real-world settings, which goes beyond what is currently possible in autonomous robotics.

(57) Abstract :

The present invention relates to a deep learning-based method for classifying earth regions from satellite images. This method utilizes advanced neural network algorithms, specifically Convolutional Neural Networks (CNNs), to automate the process of identifying and categorizing various earth regions, such as forests, urban areas, water bodies, agricultural lands, and barren regions, from satellite imagery. The invention offers an efficient, scalable, and highly accurate solution to satellite image classification, eliminating the need for manual intervention and significantly reducing processing time. The deep learning model is trained on a large dataset of labeled satellite images, enabling it to learn complex spatial and spectral features associated with different land types. The model can handle variations in satellite image quality, lighting, weather conditions, and geographical features, ensuring reliable classification results. Additionally, the method integrates multi-spectral and multi-temporal data, enhancing classification accuracy by considering various wavelengths of light and changes over time. This invention supports real-time or near real-time analysis, making it ideal for dynamic applications such as environmental monitoring, disaster management, urban planning, and agriculture. By automating the classification process, the method improves efficiency, scalability, and precision in large-scale satellite image analysis, offering a cost-effective solution for global-scale monitoring and decision-making. Key words: Deep Learning, Satellite Image Classification, Convolutional Neural Networks (CNN), Earth Region Classification

(57) Abstract :

The goal of the Raspberry Pi humanoid robot project is to use a Raspberry Pi microcontroller to design, build, and program a fully functional humanoid robot. To create a versatile and interactive robotic system, this project entails a thorough investigation of robotics, electronics, and programming methodologies. To sense its environment, move effectively, and interact with humans, the robot will be equipped with a variety of sensors, actuators, and vision systems. Designing hardware, creating software, and incorporating cutting-edge AI algorithms for decision-making and human-robot interaction are all steps in the development process. In order to demonstrate the possibilities of accessible and reasonably priced robotics solutions driven by the Raspberry Pi platform, the project will culminate with a demonstration of the robot's capabilities, including its ability to travel, finish tasks, and react to user orders. Key words : Raspberry Pi, Humanoid Robot, Design, Build, Program

(57) Abstract :

The EVAC-RD Frame is a novel dental device designed to enhance endodontic and restorative procedures by integrating advanced suction technology with a traditional rubber dam frame. It features a hollow, U-shaped metallic tube with strategically placed suction inlets on the vertical and horizontal arms for effective simultaneous intracanal and intraoral suctioning, ensuring a dry and clean operating field. The frame includes inlets to suction spilled water or irrigants, preventing soiling of the patient's clothing, and connects to a high-vacuum dental suction system for efficient drainage. By minimizing the need for manual suctioning, the EVAC-RD Frame streamlines dental procedures, improves workflow, and reduces the need for additional staff. It enhances patient comfort by preventing moisture accumulation under the rubber dam, providing a more comfortable, efficient, and hygienic treatment experience. This device offers a practical, cost-effective solution for dental practices, improving both procedural efficiency and treatment outcomes.

(57) Abstract :

ABSTRACT OF THE INVENTION Sign Language Recognition (SLR) is the process of automatically interpreting sign gestures into text or speech using computational models. Deep learning enhances SLR by learning complex spatial patterns from video or image data. This study focuses on 2D sign language recognition for deaf and mute individuals. The existing method utilizes a 2D Convolutional Neural Networks (2D CNNs) trained on the Rheinisch-Westfälische Technische Hochschule Aachen (RWTH) and American Sign Language (ASL) datasets for recognizing sign language sequences. Although effective, this method shows limited performance when applied to region-specific sign languages such as Indian Sign Language (ISL). To address this gap, we propose a novel approach based on 2D Sign Language Recognition (2D SLR) using Convolutional Neural Network (CNN) trained on an Indian Sign Language dataset. In sign language recognition (SLR), CNNs are used to extract spatial features from video frames They typically process RGB images, depth maps, or optical flow to capture the visual patterns essential for sign recognition. CNNs handle variations in lighting, background, and signer appearance better than hand-crafted features and Some architectures use spatial attention or focus mechanisms to better capture relevant signing regions (like hands). capturing hand shapes and movements with text and speech. Keywords: Sign Language Recognition (SLR), American Sign Language (ASL) dataset, Convolutional Neural Network (CNN), Indian Sign Language (ISL), Spatial- Modelling.

(57) Abstract :  
ABSTRACT OF THE INVENTION Title: Event-Driven Distributed Data Mesh for Real-Time Contextual Intelligence Across Physical and Digital Assets The invention discloses a distributed, event-driven data-mesh architecture that federates domain-specific nodes across operational-technology and information-technology environments. Each node exposes streaming data products under strict contracts, while a central Contextual Intelligence Engine unifies events into a semantic graph for millisecond-level reasoning. A governance layer embeds zero-trust security, lineage, and compliance, and an actuation interface converts insights into automated controls or alerts. The invention delivers scalable, low-latency, policy-compliant intelligence without relying on monolithic data lakes, thereby enabling predictive maintenance, supply-chain resilience, digital-twin synchronisation, and other cross-domain real-time applications.

(57) Abstract :  
ABSTRACT OF THE INVENTION Title: Predictive Incident Management System Using Cross-Sensor Temporal Patterns and Scalable Rule Engines Abstract: The invention relates to a predictive incident management system designed to anticipate failures and anomalies by leveraging temporal correlation across multi-sensor data streams and executing intelligent rules through a scalable rule engine. The system includes components for sensor data ingestion, time-series correlation, complex event processing, rule-based decisioning, and automated incident response. By combining AI-driven pattern recognition with customizable rule logic, the invention ensures minimal downtime, contextual alerting, and proactive remediation across industrial or IT environments. The invention is adaptable to various deployment scenarios including cloud, fog, and edge, ensuring scalability and resilience.

(57) Abstract :

The present invention relates to a smart human presence sensor for a home automation system. The system (100) comprises a smart sensor module (102), a signal conditioning unit (104), a microcontroller unit (106), a presence detection algorithm unit (108), a device control module (110), a user configuration interface (112), a communication interface (114), and a power supply unit (116). The smart sensor module (102) detects both static and dynamic human presence through micro-movement sensing technologies. The signal conditioning unit (104) filters and amplifies the sensor signals received from the smart sensor module (102). The microcontroller unit (106) processes the conditioned signals in real-time to detect occupancy. The presence detection algorithm unit (108) analyzes signal patterns to differentiate between actual human presence and noise. The device control module (110) sends control signals to home appliances based on detected presence. The user configuration interface (112) allows the user to adjust parameters like sensitivity, detection range, and delay time. The communication interface (114) transmits presence data and device status to external systems. The power supply unit (116) provides electrical power to all components of the system. The invention enhances precision in detecting subtle human presence and facilitates energy-saving automation in smart home environments.

(57) Abstract :

The Clothing Recommendation System is an AI-powered platform designed to assist users in selecting and pairing clothing items efficiently through the analysis of input images and natural language prompts. The system comprises modules for image captioning, context-aware recommendation, and wardrobe integration, enabling three primary functionalities: suggesting compatible items for potential purchase, recommending combinations from a user’s existing wardrobe, and generating complete outfit suggestions tailored to specific contexts or events. The platform utilizes vision-language models to extract descriptive data from images, which are processed by a language model to provide relevant and personalized recommendations. Real-time retrieval of publicly available product data ensures up-to-date suggestions, while integration with the user’s wardrobe enhances reuse and promotes sustainable clothing practices. The modular and scalable architecture supports seamless user interaction, accommodates a variety of style preferences, and integrates smoothly into everyday use, offering a new approach to personal clothing selection.

(57) Abstract :

The present invention relates to an RFID-based attendance tracking system utilizing a microcontroller or embedded processor as the central processing unit. The system (100) comprises a RFID tag (102), a RFID reader unit (104), a processing unit (106), a verification module (108), a database/storage unit (110), a real-time clock module (112), a display and notification unit (114), a communication interface (116), and a power supply unit (118). The RFID tag (102) is assigned to individual users and carries a unique identification code. The RFID reader unit (104) detects and reads the identification code from the RFID tag (102) when brought within proximity. The processing unit (106) receives the data and initiates verification through the verification module (108). The database/storage unit (110) stores user records, attendance logs, and configurations. The real-time clock module (112) timestamps each record. The display and notification unit (114) provides feedback to the user. The communication interface (116) enables transmission to external systems or cloud services. The power supply unit (118) ensures operation of all modules. The invention facilitates contactless, accurate, and real-time attendance management while promoting system adaptability and integration with institutional infrastructure.

(57) Abstract :  
This invention introduces AeroGrid, a decentralized drone swarm framework designed for real-time environmental surveillance through intelligent coordination and mesh-IoT communication. Each drone operates autonomously, collaboratively electing a leader based on dynamic health and performance metrics to ensure robust swarm management. The system leverages edge-AI modules embedded on the drones to process environmental data locally, enabling rapid detection of threats such as wildfires, gas leaks, or chemical hazards. To maintain communication resilience in variable network conditions, AeroGrid incorporates a LORA-based fallback mechanism. Its modular and scalable architecture allows for flexible deployment across diverse applications including disaster response, precision agriculture, and military reconnaissance. The adaptive nature of the framework ensures continuous operation even in infrastructure-deficient or high-risk environments, making it an ideal solution for next-generation autonomous aerial surveillance and decision-making systems.

(57) Abstract :

The invention presents Sentinel Skin, an advanced AI-powered combat vest engineered to enhance soldier safety and situational awareness during high-risk operations. Integrated with a network of biosensors and environmental analytics modules, the system continuously monitors vital signs such as heart rate, body temperature, and stress indicators, alongside external threats including temperature extremes, toxic gases, and ballistic impact. Leveraging machine learning algorithms, Sentinel Skin calculates a real-time Combat Stress Index to evaluate a soldier's physiological and psychological state, enabling early detection of trauma or critical health deterioration. The vest also features blockchain-enabled communication protocols to ensure secure and tamper-proof transmission of tactical and biometric data across defense networks. Furthermore, the system offers autonomous triage support by identifying and prioritizing critical cases in the field. Designed for defense personnel and first responders, Sentinel Skin significantly improves survivability and mission efficiency through proactive, intelligent decision-making support.

(57) Abstract :

Smart battery monitoring system with buzzer alerts is the proposed invention. Ordinary problem that smartphone users encounter-the-effective management of battery life to extend the usability of the gadget. Smartphones, that rely on lithium-ion batteries, are susceptible to some deterioration resultant from charging cycles. Overcharging combined with continuous power supply when the gadget is fully charged in most instances accelerates deterioration to its unavailability. This Android app reduces the problem by providing real time updates on the status of the battery through customizable voice notifications. Leverage Android's Battery Manager API and the Text-to-Speech (TTS) engine, keeping a user informed of key events in the battery such as when the charging starts, battery gets disconnected from charging, and once the full charge is complete.

(57) Abstract :

The present invention relates to an automated energy supply interruption and restoration system for low-tension three-phase consumers based on prepaid metering. The system comprises a low-voltage power entry terminal [102], a load monitoring transformer [104], and a prepaid digital power meter [106] for tracking energy consumption and prepaid credit. Upon credit depletion, a distributed remote interface controller [110] issues a command through a remote actuation channel [114] to operate an automated circuit breaker module [108], interrupting the supply to the consumer power outlet interface [116]. A wireless data transmission module [118], cloud communication backbone [120], edge-side secure access gateway [122], and core server protection gateway [126] enable remote control from a central monitoring and control server [124]. A local control display unit [112] provides manual override, while client-side control interfaces [128] support user interaction. The system enables secure, reliable, and autonomous energy flow control in prepaid LT environments.

(57) Abstract :

Taking the support of an existing AI-based program, helping researchers who speak local languages to write scientific papers in English, especially for metabolomics studies using mass spectrometry (GC-MS and LC-MS). The system translates research notes from native languages into clear, correct scientific English. It uses special metabolomics databases like HMDB and KEGG to add accurate technical terms. The tool also formats the writing into various sections. It supports interpreting complex mass spectrometry data and provides feedback to improve English writing skills. This invention makes it easier for non-English-speaking scientists to share their research globally and participate in international science.

## (57) Abstract :

The present invention relates to a stabilized topical formulation of Shata Dhauta Ghrita (SDG), traditionally prepared by washing cow ghee 100 times with purified water. To overcome the limitations of oxidative instability, poor shelf life, and microbial susceptibility associated with the conventional preparation, selected pharmaceutical excipients were incorporated. The stabilized formulation includes cow ghee, ascorbic acid, stearic acid, sodium benzoate, vitamin E, and sandalwood oil. The optimized formulation demonstrated improved physicochemical stability, enhanced thermal resistance, and acceptable dermatological pH. Characterization by FTIR and DSC confirmed the absence of hydrolytic degradation and improved thermal behaviour. The formulation is suitable for dermatological applications such as moisturizing, skin repair, and anti-aging treatment, offering a scientifically validated enhancement of a classical Ayurvedic product.

(57) Abstract :

The present invention discloses a green, one-pot multicomponent method for synthesizing phenothiazine-incorporated Hantzsch pyridine derivatives using recyclable ionic liquids, such as BIL as eco-friendly catalysts. The reaction involves the condensation of N-alkylated phenothiazine-3-carbaldehyde, a  $\beta$ -keto ester, dimedone, and ammonium acetate under mild conditions, affording high yields with simplified work-up. The ionic liquid catalyst is reusable over multiple cycles without significant loss of activity, minimizing environmental impact. Significant biological activity was demonstrated by the produced compounds, which were evaluated using spectroscopic techniques, highlighting their potential as bioactive molecules for pharmaceutical applications.

(57) Abstract :

The Virtual Voice Assistant project seeks to redefine the way users interact with technology by offering a comprehensive, AI-driven digital assistant. This advanced system leverages natural language processing (NLP) and voice recognition technologies to facilitate seamless communication and task execution. Equipped with features like weather updates, news headlines, system monitoring, and multimedia control, the assistant caters to both practical and entertainment needs. It employs real-time capabilities such as performing Google searches, providing brief information on topics, generating images from text, and even managing system operations like opening files, switching tabs, and taking screenshots. Integrated with platforms like YouTube and Google Maps, it enhances user convenience with functionalities such as playing music, calculating distances, and navigating destinations. The assistant is designed with a robust architecture, ensuring high performance and user-friendly interaction. Future development will focus on expanding its abilities, refining user experience, and incorporating personalized recommendations to create a truly intelligent, all-in-one virtual companion.

(57) Abstract :  
The invention discloses a closed-chamber steam curing system for enhancement of concrete strength. The system comprises a sealed curing chamber, steam generator, and a control unit that maintains optimal temperature and pressure conditions. This enables rapid hydration, high early strength gain, and improved productivity in precast and prestressed concrete manufacturing. The experimental investigation results indicated that development of compressive strength under 9 hours vacuum curing is 10.6 % and 7.9 % more than the 28 days conventional curing compressive strength for M20 and M40 grade concretes respectively. The system reduces time, prevents thermal cracking, and ensures uniform strength distribution.

(57) Abstract :

The present invention discloses about the preparation of bioactive electrospun nanofibers for tissue engineering applications. The nanofibers had continuous, string-like morphology with occasional bead formation. They were highly porous and displayed a well-interconnected network of interlaced fibers. The nanofibers were biocompatible and possess the ability to heal wounds within 48 hours which was evident using in vitro cell culture experiments. The nanofibers can be used for tissue regeneration, drug delivery, and wound treatment.

(57) Abstract :

The present disclosure provides a system (100) for abstraction-based runtime property verification and a method for real-time safety monitoring of embedded controllers. The system processes execution traces (101) from target controllers, constructing linear state models (104), distinct state models (106), and abstract state models (109) using Boolean (111), multi-valued (112), and path (113) abstraction functions (107). Property verification (110) evaluates safety properties on abstract models with 100x state space reduction. Hardware acceleration includes FPGA-based instrumentation interfaces (103) capturing memory operations, verification processors (110) on application-specific integrated circuits (111), property transformation circuits (604), and parallel verification engines (605). This integrated approach achieves sub-millisecond verification latency for control systems operating up to one kilohertz, enabling deployment in safety-critical automotive braking systems, industrial robot controllers, and aircraft flight control systems. Unlike software-only approaches, the combination of abstraction-based model construction and hardware acceleration provides real-time property verification suitable for resource-constrained embedded controllers.

(57) Abstract :

The present invention discloses a lightweight, machine learning-integrated wearable device in the form of smart footwear for real-time, non-invasive monitoring and management of maternal and postpartum health. The device incorporates embedded physiological, biomechanical, and environmental sensors to track parameters such as heart rate, temperature, blood flow, hydration levels, fatigue, weight distribution, swelling patterns, gait, joint function, and micro-movements. Advanced features include dynamic pressure analysis and gait irregularities detection. A lightweight edge-computing module enables on-device ML inference using optimized models for immediate health insights, anomaly detection, and alerts without reliance on cloud processing. IoT connectivity facilitates periodic data synchronization with a cloud platform for trend analysis, long-term health tracking, and personalized recommendations. The wearable dynamically adapts to both pregnancy and postpartum phases, providing proactive care, early risk identification, and recovery monitoring. By integrating comfort, convenience, and intelligent analytics, the invention offers an innovative solution for enhanced maternal well-being.

(57) Abstract :

Identifying Location Using GSM Technology in Machine Learning for the Blind People ABSTRACT In order to help visually impaired people scan their environment and recognize hazards without the use of outside help, blind sticks are a useful tool. For improved topic support, the mechanical blind stick form now in use has to be upgraded. As a result, this project suggests modifying these sticks by adding sensors, micro-controllers, and buzzers to help the subject better navigate their surroundings and improve their mobility experience. The sensors detect the hurdles and obstacles from a safe distance and the micro-controller activates a buzzer to alert the user in case of threats. The model employs another unit to send location updates to kith and kins of the subject in emergency conditions with the help of GPS and GSM units Any abnormal changes in these readings result in an automated text message sent to the mentioned contacts along with the GPS location. The model is aimed to be a cost- effective and user-friendly device for aiding the visually challenged people that guarantees highly reliable navigation performance and greater user experience by offering various additional features. The PID (proportional–integral–derivative) algorithm applied in order to avoid overlapping of distance range from three sensor placed in the stick. As per the obstacles, the algorithm stops the working of corresponding ultrasonic sensor and therefore the visually challenged person can get an intimation in a accurate manner. Index Terms- PID, GPS, GSM, Ultrasonic Sensor he proposal to upgrade traditional mechanical blind sticks by incorporating sensors, microcontrollers, and buzzers aligns well with ongoing advancements in assistive technology aimed at enhancing the spatial awareness and autonomous navigation of visually impaired people. Traditional white canes, despite being reliable primary mobility tools, mainly provide tactile feedback limited to ground-level obstacles, which can result in missed detections of hazards such as overhanging objects, drop-offs, or complex environmental features. Thus, sensor integration substantially improves their hazard detection capabilities and the overall mobility experience. A robust design would incorporate ultrasonic sensors, which are widely used for obstacle detection due to their cost-effectiveness and reliable range in various environments. Ultrasonic sensors such as the HC-SR04 are proven to detect obstacles accurately at distances from around 7 cm up to 35 cm or more, providing timely alerts to users .These sensors can be arranged at strategic heights along the cane to detect obstacles both on the ground and at elevated positions, effectively reducing missed hazards. Microcontrollers such as Arduino or PIC microcontrollers serve as ideal processing units to collect sensor data, perform obstacle detection algorithms, and manage user feedback mechanisms. Low-power embedded systems employing such microcontrollers have been validated in assistive devices to enable obstacle detection, environment mapping, and control of feedback outputs .Additionally, integrating Bluetooth modules can extend functionality by connecting the stick to smartphones for GPS-enabled navigation or emergency services, as demonstrated in systems like InWalker. Feedback modalities critically influence the ease of use and user acceptance of smart canes. Vibrational (haptic) feedback and auditory signals (such as buzzer tones or voice prompts) have been widely adopted to convey proximity or hazard information without overwhelming the user. The combination of intuitive vibration patterns and audio feedback enables users to interpret environmental cues efficiently and without distraction, thereby enhancing independent mobility confidence .Studies have further shown that tailoring feedback parameters, such as the speed or intensity of voice broadcasts, can optimize obstacle avoidance performance depending on the user's perceptual preferences Ergonomics and portability remain essential design considerations to ensure that the smart stick does not impose additional physical or cognitive burdens on the user. Lightweight materials (e.g., PVC frameworks) and compact sensor modules have been successfully incorporated to maintain the usability of the device.Moreover, the mechanical design can be further enhanced by hybrid configurations, for instance, integrating wheeled wing apparatuses to improve detection of small obstacles and drop-offs without substantially increasing the device's bulk From a broader perspective, it is important to consider limitations inherent to various sensing technologies. Ultrasonic sensors have limited range and can be affected by the surface characteristics of obstacles, whereas laser-based systems, though more precise, pose safety risks if misdirected. Electromagnetic sensors, including microwave radars, are emerging as alternatives offering longer detection ranges and noise tolerance, yet miniaturization and cost remain challenges. In conclusion, the addition of ultrasonic sensors, microcontrollers, and feedback systems to the traditional blind stick is a validated and practical approach to improving hazard detection and environmental scanning for visually impaired individuals. Successful prototypes demonstrate enhanced obstacle avoidance, detection of complex obstacles (including hollowed structures), and integration with assistive technologies such as GPS .Future developments should emphasize customizable feedback settings aligned with user perceptual patterns, ergonomic design for ease of use, and expansion towards multi-sensor systems to overcome limitations of single sensor modalities. Such smart blind sticks effectively reduce reliance on external assistance, promote independent mobility, and contribute to the inclusivity of visually impaired individuals.

(57) Abstract :

"Synergistic Herbal Formulation of Turmeric, Black Pepper, Dry Ginger, Long Pepper, and Brahmakamal for Enhancing Immunity and Combating Infections" The present invention relates to a synergistic herbal composition comprising Turmeric (*Curcuma longa*), Black Pepper (*Piper nigrum*), Dry Ginger (*Zingiber officinale*), Long Pepper (*Piper longum*), and Brahmakamal (*Saussurea lappa*), formulated to combat bacterial, viral, and fungal infections while simultaneously enhancing the body's immune response. The composition offers a broad-spectrum antimicrobial activity through synergistic interactions between the active phytoconstitu-ents—such as curcumin, piperine, gingerols, and unique bioactive compounds of Brahmakamal like methyl palmitate, linalyl acetate, and beta-sitosterol. The formulation also demonstrates immuno-modulatory effects, enhancing the activity of immune cells (e.g., macrophages, lymphocytes, and natural killer cells) and regulating cytokine responses. The invention optimizes herb ratios and dosage forms (churna, tablets, and capsules) to improve bioavailability, stability, and efficacy while ensuring safety and long-term use without synthetic addi-tives or risk of antimicrobial resistance. The invention provides a cost-effective, scalable, and stand-ardized approach for managing infections and supporting immunity, suitable for pharmaceutical, nutraceutical, and Ayurvedic applications. The composition is validated through phytochemical anal-ysis, in vitro antimicrobial studies, and literature-supported evidence of synergistic interactions and bioactivities.

(57) Abstract :

ABSTRACT The present invention relates to a dynamic LED propeller display system (100) that utilizes persistence of vision (POV) to render visual content in mid-air through high-speed rotation of a rotatable support structure (102). The system comprises a matrix of light emitting diodes (LEDs) (104) mounted on a rotating perfboard, controlled by a microcontroller (106) that processes incoming data to generate dynamic content including text, images, and low-resolution animations. A motor assembly (108) facilitates high-speed rotation, while a position sensing unit (110) comprising a Hall effect sensor and magnet ensures frame synchronization by detecting a reference angular position. A data interface module (112), such as USB, Wi-Fi, or Bluetooth, allows for real-time content updates from external sources. The system further includes a power supply circuit (114) with appropriate resistors and a thermal management mechanism (116) to ensure reliable and efficient operation. The microcontroller (106) coordinates the timing of LED (104) illumination based on rotational speed and angular position, creating a visually coherent display observable to the human eye. The figure associated with the abstract is Fig.1

(57) Abstract :

The present disclosure relates to a system for indexing dental models to enable accurate repositioning of sectioned cast segments. The system comprises a maxillary indexing template (102) and a mandibular indexing template (104), each adapted to form defined indexing grooves on dental casts during fabrication. The maxillary indexing template (102) includes a transverse groove (106) and a longitudinal groove (108) arranged to intersect, creating a cross-shaped pattern on a maxillary cast. The mandibular indexing template (104) includes a left ridge (110) and a right ridge (112) arranged to form angular or V-shaped grooves on a mandibular cast. The templates are designed to be placed over unset dental plaster or stone and removed after setting, leaving behind precise groove patterns. These grooves function as physical references to allow accurate realignment of dental cast sections during prosthetic or orthodontic workflows.

(57) Abstract :

ABSTRACT EEG BASED HUMAN STRESS LEVEL PREDICTOR HEADBAND The present invention relates to a wearable EEG-based headband designed for real-time human stress level prediction using a simplified two-electrode configuration positioned at the T7 and T8 scalp locations. The device integrates dry-contact electrodes, advanced signal acquisition hardware, Bluetooth Low Energy communication, and a mobile interface. EEG data is processed using a custom deep learning model (EEGNet) deployed on a backend server, enabling accurate stress classification. The system achieves low-latency inference, high comfort, and user-specific adaptability, offering a portable, non-invasive, and clinically validated solution for continuous stress monitoring in everyday environments. (57) Abstract :

ABSTRACT The invention discloses a smart brick drying system that integrates solar-powered thermal energy, IoT-enabled environmental sensing, and edge-based lightweight deep learning for autonomous operation. The system comprises a drying chamber, a solar thermal unit, and a network of sensors configured to measure temperature, humidity, and brick moisture levels. Sensor data is processed in real time by one or more edge computing devices running a lightweight deep learning model to determine optimal drying conditions. A control module dynamically adjusts heat, airflow, and drying duration based on model output. The system includes a user interface to display real-time metrics and alerts, ensuring enhanced energy efficiency, defect reduction, and suitability for off-grid environments. The invention is particularly beneficial for sustainable and decentralized construction applications.

(57) Abstract :

AN AUTOMATED SYSTEM AND METHOD FOR CONVEYING, INSPECTING AND SORTING HIGH ASPECT-RATIO OBJECTS The present invention relates to a system (100, 600) and method for conveying, inspecting, and sorting high aspect-ratio objects in automated quality control processes. The system (100, 600) comprises a feeder unit (102) for introducing objects, a belt conveyor unit (104) with a continuous loop driven by a motorized drive pulley (404) and tension-rotated driven pulley (406), and image sensors (106A-B) positioned along the conveyor path to capture multiple views of each object. A microcontroller (110) receives and processes the captured image data in real-time to detect surface defects. Upon identifying defective objects, the microcontroller (110) triggers a separator unit (108) with a flip plate mechanism to redirect such objects to a reject path. The invention addresses the labor shortage challenges in industries like incense sticks manufacturing by offering a cost-effective solution capable of improving quality assurance. FIG. 1

(57) Abstract :

Traditional centralized processing approaches suffer from high latency, bandwidth limitations, and privacy concerns. To overcome these challenges, the proposed system integrates lightweight deep learning models, adaptive edge computing, and distributed inference strategies to enable context-aware visual analytics directly at or near the point of data capture. The system supports a wide range of tasks such as object detection, behavior recognition, and anomaly identification, while dynamically adapting to environmental changes, device constraints, and network conditions. By transforming visual sensors into autonomous, intelligent agents capable of real-time interpretation and collaborative learning, the invention significantly enhances the performance, privacy, and scalability of IoT deployments. This solution offers a robust foundation for next-generation applications in public safety, smart infrastructure, and responsive environmental systems.

(57) Abstract :

ABSTRACT The present invention discloses a Multi-Sensor and AI-Based Portable Analyzer Device for Honey Adulteration Detection that enables real-time, non-destructive, and field-deployable analysis of honey quality. The system comprises a compact, handheld housing integrating a multi-sensor array including UV-VIS, near-infrared (NIR), digital refractometer, pH, and conductivity sensors, which together capture both spectral and physicochemical signatures of honey samples. A microcontroller unit preprocesses the acquired data and transmits it to an embedded artificial intelligence (AI) engine configured with machine learning models trained on validated datasets of pure and adulterated honey. The AI engine performs sensor fusion and inference to classify the authenticity of the sample and identify the presence of adulterants. Results are visualized through a mobile or cloud-connected dashboard that provides real-time alerts, risk scores, and personalized advisories. The device supports offline operation, data logging, and periodic synchronization with regulatory databases. This invention overcomes the limitations of traditional laboratory-based, destructive testing methods by offering a rapid, accurate, and user-friendly solution for on-site honey adulteration detection, thereby enabling greater transparency, traceability, and consumer safety.

(57) Abstract :

The invention relates to an intelligent medical report analysis and health recommendation system (100) comprising an image acquisition module (101) configured to receive medical reports in image or scanned format, an image preprocessing module (102) for enhancing image quality, an OCR module (103) to extract machine readable text and a text processing module (104) uses natural language processing to clean and structure the extracted text. A user input module (105) collects contextual data such as age, sex, symptoms and lifestyle habits and an AI module (106) comprising a language interaction framework and a large language model processes these inputs to generate personalized health recommendations. A chat interaction module (107) enables multi-turn, context-aware responses and a user interface module (108) user interaction and output display. The system is configured to operate locally on a computing device (D), providing real-time interpretation and personalized health recommendation without reliance on medical professionals.

(57) Abstract :

This project introduces Melodivibe, a socially enhanced music streaming application that redefines how users interact with music. Built using a robust tech stack comprising React-Native, Expo Libraries and firebase service, it offers seamless song search, playlist creation, and real-time streaming via cloud storage of firebase and CDNs. Secure Firebase authentication login ensures personalized and protected user experiences. The app stands out with innovative features like Music Rooms which work just like YouTube live where music enthusiasts can create public or private spaces for shared music listening. Karaoke mode allows users to sing along, record, and share performances, while real-time liked folders, friend's interaction section via an interaction focused system of firebase add a social dimension to the music experience. Powered by scalable architecture, Melodivibe supports future enhancements like personalized recommendations. Designed as a cross-platform app using react native, it offers seamless functionality, delivering an immersive, creative, and community driven music experience.

(57) Abstract :

A smart irrigation system is disclosed for automated and optimized agricultural environment management. The system comprises an ESP32 microcontroller with integrated Wi-Fi and Bluetooth capabilities, serving as the central control hub. It includes a soil moisture sensing module, a temperature and humidity sensor (DHT11), a light intensity sensor (LDR), and a waterlogging detection sensor (IR), all configured to collect real-time environmental data. The system further comprises a threshold control unit—adjustable manually via a potentiometer or digitally through a mobile application—for controlling irrigation sensitivity. An irrigation actuator operates based on soil moisture thresholds, while a PIR-based motion detection module and ultrasonic emitter deter wildlife non-lethally. A filtration unit ensures water purity, and a solar-powered power supply supports off-grid operation. A mobile application enables real-time data visualization, multilingual interface, and remote/manual control. The modular architecture allows scalability. The microcontroller manages energy via sleep mode and orchestrates system functions for efficient, adaptive irrigation control.

(57) Abstract :

This invention relates to a green-synthesized micronutrient nanoparticle consortia designed for sustainable agriculture. Utilizing green synthesis methods, the invention synthesizes nine agriculturally significant nanoparticles CaO, CuO, FeO, MnO, MgO, MoO, NiO, SO, and ZnO in specific ratios to create a synergistic, colloiddally stable formulation. The resulting nanoparticle blend is prepared as a concentrated suspension, readily diluted in water for application via seed priming, foliar spray, or soil drenching. This novel system addresses common soil micronutrient deficiencies, enhances plant growth, and imparts intrinsic antimicrobial properties for crop disease management. The method minimizes environmental impact by avoiding hazardous chemicals and leveraging renewable green synthesis based extracts, ensuring compatibility with a broad range of crops and farming practices. The invention offers an effective, eco-friendly alternative to conventional fertilizers and pesticides, supporting higher agricultural productivity and improved soil health.

(57) Abstract :  
Enhancing occupancy flow prediction for autonomous driving: a scalable framework with advanced spatial-temporal modeling is the proposed invention. Accurate prediction of traffic agents’ future states is essential for safe and efficient autonomous driving, especially in dynamic and occluded urban environments. Traditional methods often struggle to model spatial-temporal dependencies, motion continuity, and directional dynamics, leading to suboptimal decision-making and increased safety risks. To address these challenges, this study enhances the Occupancy Flow Field (OFF) framework, integrating occupancy and motion flow predictions into a unified Bird’s-Eye View (BEV) representation. The STrajNet architecture is augmented with a Swin Transformer-based visual encoder, trajectory-aware cross-attention mechanisms, and a feature pyramid decoder (PyrDecoder) for multi-scale spatial-temporal feature fusion

(57) Abstract :

ABSTRACT The present invention discloses a novel method and a sophisticated apparatus designed for significantly enhancing vehicle suspension systems through the application of advanced kinematic principles and dynamic analyses. The apparatus incorporates a multi-link suspension mechanism seamlessly integrated with adaptive dampers and an intelligent control unit that employs real-time kinematic and dynamic computations. The method entails optimizing suspension geometry through rigorous mathematical modeling of vehicle dynamics, dynamically adjusting damper characteristics in response to varying road conditions, and leveraging comprehensive sensor feedback for precise and accurate control. This innovative invention markedly improves ride comfort, enhances handling stability, and boosts energy efficiency by dynamically adapting to diverse terrains and driving scenarios. The system is versatile and applicable to both passenger vehicles and commercial vehicles, offering a scalable and adaptable solution to meet the demands of modern automotive suspension requirements.

(57) Abstract :  
The invention discloses a deep learning-based system and method for early prediction of heart disease using integrated clinical and behavioral data. It includes modules for data collection, preprocessing, feature integration, deep model training, and risk prediction. The system leverages advanced neural network architectures to process heterogeneous data and generate accurate, interpretable predictions. Designed for deployment in clinical environments, the invention supports real-time decision-making and preventive healthcare interventions, offering improved accuracy and usability compared to traditional models.

(57) Abstract :

The present subject matter includes a method (1000) to maintain an 1800 phase difference between two switch states. The method (1000) includes receiving, by a switch unit, power being provided by a differential antenna (104). The power is allowed a passage to a differential quadrature hybrid coupler (110). The method (1000) includes splitting, by the differential quadrature hybrid coupler (110), the power equally into two-halves. The method (1000) includes generating, by a short replica switch unit (112a), and an open replica switch unit (112b), a first reflected output and a second reflected output based on the two-halves of the power. The open replica switch unit (112b) consistently undergoes a change within a predetermined range of a gate voltage in a uniformly incremental manner by consistently receiving a voltage from a control switch (114). The method (1000) includes transmitting, by the plurality of replica switch units (112), the first reflected output and the second reflected output to the differential quadrature hybrid coupler (110) that generates a first output. The method (1000) includes generating, by a plurality of peak detectors (116), a plurality of signals based on the first output to be compared to determine the voltage required to be provided to the open replica switch unit (112b) within the predetermined range for maintaining the relative 1800 phase difference between the short replica switch unit (112a) and the open replica switch unit (112b).

(57) Abstract :

This invention proposes a multimodal framework designed to enhance deepfake detection by integrating visual lip-reading analysis and audio signal processing for real-time applications. Leveraging LipNet—a deep learning model pre-trained on the GRID dataset—the system employs 3D convolutional neural networks (CNNs) combined with bidirectional long short-term memory (Bi-LSTM) layers to interpret lip movements and decode spoken words from visual inputs. Simultaneously, audio analysis modules evaluate acoustic features to detect synthetic or manipulated speech. By independently training these components and combining their outputs, the framework identifies inconsistencies between visual and auditory modalities, such as mismatched lip-audio synchronization or unnatural speech patterns. Experimental results demonstrate robust performance in both word-level lip-reading accuracy and deepfake detection reliability, achieving high precision in flagging fraudulent content. The system's effectiveness in detecting audiovisual anomalies positions it as a practical tool for digital forensics and security applications, with potential to foster trust in digital media. Future work will expand the model's adaptability to diverse datasets, including multilingual contexts, and refine its integration into real-world media authentication and accessibility tools

(57) Abstract :

This study presents a method for the development of the water quality influences the fish's growth, which is vital in Andhra Pradesh and Telangana, to some extent in other places where fishes like Catla catla, Labeo rohita, Cirrhinus mrigala, etc., are raised. The review analyses the effects of temperature, dissolved oxygen, pH, ammonia, and turbidity on the growth performance of these species in the region. Information obtained on various aquaculture farms within the two states shows that variability in water quality is rather large and that it impacts on growth, health, and yield of the fish. The results of the study support the fact that water condition is a critical factor in maintaining and enhancing profitable aquaculture and provide specific guidelines for water quality control to enhance the production of aquaculture farms. Furthermore, the article discusses local factors such as irregularities in monitoring and poor farmer information and underlines the presence of a requirement to apply interventions to boost water quality management locally. (57) Abstract :

This product is made for peoples use, It is more useful and more benefited. This Invention product is made safe and secure system. When we use the product, it will precent the car from Heavy Water Flood damage. This product is made with an New Technic and well Mechanism. The technic and mechanism makes very good performance in every time usage. All this made by Iron and Mechanism only. Purely it is working with Non-Electrical. No Hydraulic or Air compression.

(57) Abstract :  
Abstract: The present invention is an implementation of AI-powered robotic chatbot for intelligent customer interaction. An AI-powered robotic chatbot system designed to facilitate and automate food ordering and delivery-related interactions. An utilizing natural language processing through Dialogflow, backend integration with MySQL for data persistence, and FastAPI for seamless API communication, the chatbot provides an intelligent interface for users to place new orders, check delivery status, modify existing orders, and cancel orders in real time and the system enhances user experience by simulating human-like conversations while ensuring fast, accurate, and efficient processing of customer requests. A scalable, customizable for different restaurant platforms, and supports both text and voice-based interactions, making it suitable for diverse food service environments.

(57) Abstract :

Abstract: Face Trace AI is a facial recognition-based web application designed to verify and trace human faces from uploaded images using deep learning techniques. The system is built using the Flask web framework and leverages the Deep Face library to perform face detection and verification. Users can upload a photo, which is then matched against a pre-existing image database to identify and trace the individual. The application ensures robust performance by validating file types and image quality, supporting real-time face analysis through a user-friendly interface. Face Trace AI has practical applications in identity verification, surveillance, and automated attendance systems, making it a valuable tool in both security and administrative contexts. (57) Abstract :

Title: A method for the production of biofuels and other products from Used Sanitary Napkin waste. The present invention relates to a sustainable method for the treatment and disposal of Used Feminine Sanitary Napkin waste (USNW) (1), enabling complete resource recovery. The process involves sterilization (2) and segregation of used sanitary napkin waste into biodegradable and non-biodegradable fractions (3). The biodegradable portion undergoes a single-stage biological pretreatment using the EBS-45 bacterial strain, achieving saccharification (4). The resulting solubilized liquid is fermented using *Saccharomyces cerevisiae* for bioethanol production (5) with a high conversion yield. The remaining solid fraction is anaerobically digested to produce biogas containing approximately 65.5% methane (7). The liquid digestate from digestion is used as fertilizer to enhance Napier grass growth (8), while the solid digestate is composted with Napier biomass (9). Non-biodegradable components are subjected to pyrolysis at 450°C to recover fuel oil and biochar (10). This method ensures a zero-waste system with production of bioethanol (6), biogas, compost, fertilizer, fuel oil, and biochar from used sanitary napkin waste. Figure 1

(57) Abstract :

ABSTRACT In today's competitive market, accurate sales forecasting is essential for effective business planning, inventory management, and strategic decision-making. This project explores the use of machine learning (ML) techniques to predict future sales based on historical data and key influencing factors such as pricing, promotions, seasonal trends, and economic indicators. The proposed system utilizes various supervised learning algorithms including Linear Regression, Decision Trees, and Random Forests to model sales data and identify patterns. Data preprocessing, feature engineering, and model evaluation techniques are employed to enhance prediction accuracy. By comparing the performance of different models using metrics such as Mean Absolute Error (MAE) and Root Mean Squared Error (RMSE), the most suitable algorithm for sales prediction is selected. The results demonstrate that machine learning can significantly improve the accuracy of sales forecasts, enabling businesses to make data-driven decisions and optimize their operations. This study provides a scalable and automated approach to sales prediction, offering valuable insights for retailers and enterprises seeking to enhance their forecasting capabilities.?

(57) Abstract :

Murburn-driven soil remediation presents a groundbreaking, synergistic methodology for the degradation of organic pollutants and transformation of biomass, thereby restoring soil health and ecosystem balance. By harnessing the oxidative power of Murburn reactions, this innovative strategy facilitates the efficient breakdown of complex pollutants, while concurrently transforming biomass into valuable resources. This approach holds significant promise for sustainable, cost-effective remediation of contaminated soils: mitigating environmental risks: promoting ecosystem resilience) and supporting long-term ecological sustainability. By leveraging the Murburn concept, this technology provides a novel paradigm for addressing organic pollution in soil, with potential applications in environmental remediation, agriculture, and ecosystem conservation

(57) Abstract :

Abstract The Automated Clothesline System is an intelligent, sensor-based device designed to detect rain and automatically relocate clothes to a sheltered area. This innovation eliminates the need for manual intervention by using a smart mechanism that pulls the clothesline or washing line without human effort. The system is built using a rainwater sensor, a PIC16F877 microcontroller, and a DC motor. The rain sensor detects the presence of precipitation, and upon detection, signals the microcontroller to activate the motor circuit. This action pulls the clothesline to a protected area, thereby preventing the clothes from getting wet. All electronic circuits were constructed and tested individually before being integrated into a fully functional prototype. The microcontroller was programmed to control the motor operation based on input from the water sensor. The final prototype, developed on a miniature scale, successfully demonstrated the feasibility and effectiveness of the system. In an enhanced version of the system, an Arduino microcontroller replaces the PIC for added functionality. Two DC motors are used to move the clothes rack between indoor and outdoor locations, depending on weather conditions. The Arduino is equipped with Wi-Fi connectivity and integrated with the Blynk mobile application, which allows users to: • Remotely control the movement of the clothesline • Monitor real-time sensor data (rain detection, rack position, etc.) • Receive notifications on weather changes and rack status Additional advanced features include: • Manual remote control of wheel movement • Path recording and playback, enabling the rack to follow predefined routes • Reverse path execution for returning to the original position • Storage of all paths and settings in EEPROM, preserving data across power cycles This smart clothesline system is not only suitable for household use but can also be integrated into clothing bags, backpacks, and outdoor furniture. Its compact design, smart automation, and user-friendly interface make it a convenient solution for commuters, travelers, and outdoor enthusiasts to protect their clothes from unexpected rain showers.

(57) Abstract :

The present invention relates to a multifunctional scalp treatment device comprising a handheld housing with a comb head incorporating therapeutic and fluid delivery modules. The device includes a plurality of comb teeth (104) embedded with light-emitting elements (402) for red and violet phototherapy, electrodes connected to a radiofrequency generator (504) and an electrical muscle stimulation unit (505), an ultrasonic vibration motor (506), and a fluid dispensing system. The fluid system comprises a removable cartridge (300), a microfluidic pump (507), and a plurality of dispensing catheters (201) with magnetic ball elements (202) for scalp-directed fluid release during combing. A control interface (103) and microcontroller (502) coordinate the activation of individual modules. The device enables customizable therapy for hair stimulation, scalp nourishment, and transdermal serum delivery. The integration of programmable, multimodal stimulation with controlled topical application distinguishes the invention over conventional scalp therapy systems.

(57) Abstract :

Respiratory health is a critical aspect of overall well- being, especially in the wake of adding air pollution and the global frequency of respiratory conditions similar as asthma, COPD, and post-COVID complications. Traditional spirometry bias, while effective, frequently warrant the portability, connectivity, and real- time data analysis capabilities needed for nonstop and remote health monitoring. This design proposes the development of an IoT- enabled Smart Spirometer designed to give accurate, real- time lung function assessment while enabling flawless data transmission to healthcare providers. The proposed device measures crucial respiratory parameters similar as Forced Vital Capacity (FVC), Forced Expiratory Volume in 1 alternate (FEV 1), and Peak Expiratory Flow (PEF) using advanced detector technology. Integrated with a microcontroller and IoT module, the spirometer transmits data to a secure pall platform where it can be covered, anatomized, and participated with clinicians. A companion mobile opera

(57) Abstract :

The present invention relates to a novel corrosion-inhibiting coating composition comprising red oxide pigment synergistically enhanced with graphene nanosheets for the protection of mild steel substrates. The coating exhibits superior electrochemical performance, forming a uniform and adherent barrier that inhibits corrosion reactions even under aggressive environmental conditions. Graphene, due to its exceptional impermeability, mechanical strength, and electrical conductivity, acts as a nano-reinforcement within the red oxide matrix, significantly extending the diffusion path of corrosive agents and improving the protective properties of the film. Electrochemical techniques such as Tafel polarization, linear polarization resistance (LPR), and electrochemical impedance spectroscopy (EIS) confirm a marked reduction in corrosion current density and increased polarization resistance, demonstrating mixed-type inhibition behavior. The adsorption of inhibitor species follows Langmuir isotherm kinetics, predominan

(57) Abstract :

The invention relates to a novel biohybrid robotic system that integrates living plant or fungal tissues into soft robotic platforms through a patterned scaffold design. The system utilizes engineered biocompatible patterns—such as microchannels, surface textures, or biochemical gradients—to direct the spatial growth and alignment of biological tissues within or on robotic substrates. These living tissues serve functional roles such as actuation, structural support, or environmental sensing. By leveraging natural growth behaviors and stimuli-responsive properties of organisms like mycelium or tendril-forming plants, the invention enables programmable, self-growing, and biodegradable robotic structures. The biohybrid system offers significant advantages in sustainability, adaptability, and energy efficiency over conventional robotics, and can be applied in eco-robotics, environmental monitoring, soft medical devices, and agricultural automation. A fabrication method is also disclosed, involving scaffold prepar

(57) Abstract :

The present invention relates to an environmentally friendly, water-soluble plastic composition comprising biodegradable polymers and functional additives or dopants. The formulation is designed to achieve controlled water solubility ranging from a few seconds to several hours, depending on environmental conditions and additive concentration. Upon dissolution, the material degrades into non-toxic byproducts such as carbon dioxide, water, lactic acid, or microbial biomass, eliminating microplastic residue. The biodegradable base polymers include, but are not limited to, polyvinyl alcohol (PVA), polylactic acid (PLA), and starch-based compounds. Additives such as glycerol, polyethylene glycol (PEG), and natural fibers are used to modulate solubility rate, mechanical properties, and eco-safety. The invention is applicable to single-use consumer products, detergent pods, agricultural films, and medical packaging. This invention provides a scalable, cost-effective, and sustainable alternative to conventional plast

(57) Abstract :  
The present invention relates to dopant-engineered hybrid quantum materials based on two-dimensional (2D) systems for use in multi-modal sensor applications. The invention discloses a method for precisely doping 2D materials, such as graphene, MoS<sub>2</sub>, WS<sub>2</sub>, h-BN, or black phosphorus, with selected transition metals or rare-earth elements to modulate key quantum properties, including bandgap energy, spin polarization, valley splitting, and carrier mobility. The resulting doped hybrid material exhibits enhanced quantum effects and is integrated into sensor platforms capable of detecting chemical, optical, magnetic, biological, and pressure stimuli with high sensitivity, fast response, low power consumption, and ambient-temperature operation. The invention also provides a fabrication process for controlled dopant incorporation and device integration, enabling scalable production of quantum-enhanced sensors for advanced electronic, environmental, biomedical, and wearable applications.

(57) Abstract :  
The present invention provides a novel, AI-assisted, pattern-based system for the selective identification, mapping, and eco-friendly extraction of rare earth elements (REEs) from marine geological formations, particularly targeting seafloor deposits such as those found in the Rio Grande Rise. The system integrates geological analysis, pattern recognition, and industrial application mapping into a unified framework that correlates parent rock types with associated REE types, relevant technological applications, and optimized, low-impact extraction methods. Key components of the system include a geological analysis module, a pattern-matching engine, an AI-based REE prediction model, and an environmentally guided extraction recommendation unit. Remote sensing technologies such as autonomous underwater vehicles (AUVs) and seafloor spectrometers provide real-time input, while an intelligent dashboard interface connects REE resource data with market-specific demands. The invention addresses the growing need for su

(57) Abstract :

A novel cement alternative comprising reactive magnesium silicate and optional activators capable of capturing CO<sub>2</sub> during and after curing. The composition reacts with CO<sub>2</sub> via mineral carbonation, forming stable magnesium carbonates. The system offers substantial carbon sequestration potential while retaining structural integrity comparable to traditional Portland cement. This invention provides a scalable, low-carbon alternative for green construction and carbon-negative infrastructure.

(57) Abstract :

The present invention discloses an intelligent framework that integrates Artificial Intelligence (AI), Machine Learning (ML), Internet of Things (IoT), and Reinforcement Learning (RL) for real-time optimization of Distributed Energy Resources (DERs) within smart grid environments. The system utilizes IoT-enabled sensors and edge computing to monitor and control solar panels, wind turbines, battery storage units, electric vehicles, and responsive loads. A reinforcement learning-based control agent continuously interacts with the environment to learn optimal energy dispatch strategies, enhancing system reliability, cost efficiency, and adaptability. The invention includes a digital twin for simulation and pre-deployment training of RL agents, ensuring robustness against variability in load demand and renewable generation. The architecture supports decentralized operation, dynamic load balancing, fault resilience, and integration with peer-to-peer energy markets. The proposed solution enables scalable and autonomous energy management in hybrid AC/DC microgrids, making it ideal for smart campuses, industrial parks, residential grids, and utility networks. (57) Abstract :

The embodiments of the present invention provide a volumetrically efficient water geyser comprising a beading, a storage tank, a bottom end plate and a service plate. The beading is an elastomeric T-shaped structure with a surface adhesive. The storage tank is a cylindrical hollow structure with open ends. The bottom end plate is mated with a bottom opening of the storage tank through the beading. A bent rim structure is provided on the bottom plate for mating into the beading. The bottom end plate allows a pair of passage of water inlet and outlet. The top end plate is mated with the storage tank through the beading. The service plate mounted onto the bottom end plate. The service plate houses an electronic and electrical circuits for power and communication control.

(57) Abstract :

Abstract: The present invention is a robotic finger detection using YOLOv10, a method claim, a robotic fingers are critical in the realization of precision and flexibility when dealing with object handling tasks. A combining YOLOv10, the latest real-time object detection model, with robotic systems enhances detection, handling, and responsivity and the focus of this project is to endow robotic fingers with intelligent recognition ability for handling varied objects with enhanced accuracy. With YOLOv10's high performance, the system hopes to transform object interaction in industry and real-world applications.

(57) Abstract :  
Abstract: The present invention is an e-learning system for empowering education through engagement and personalization. A web-based platform designed to enhance digital education through real-time assessment, personalized content delivery, gamification mechanisms, and AI-driven student support. A leveraging modern web and cloud technologies, the system addresses key limitations in existing e-learning solutions, including limited interactivity, static content, delayed feedback, and lack of intelligent assistance and the architecture is built using the MERN stack (MongoDB, Express.js, React.js, Node.js), integrating rule-based automation and a recommendation engine to offer adaptive learning experiences. An overall system architecture and the interconnections among its functional components.

(57) Abstract :  
This invention introduces Neuro Learn Edge, a standalone educational assistant designed to deliver intelligent, personalized learning experiences in offline and low-connectivity environments. Powered by embedded Natural Language Processing and emotion AI, the system analyses learners' facial expressions, voice, and behavioural cues in real time to assess engagement levels, emotional states, and comprehension. Based on these inputs, it dynamically adjusts instructional strategies, such as pacing, tone, content complexity, and feedback style, to better suit the learner's needs. Neuro Learn Edge supports a wide range of regional languages and dialects, making it highly accessible in rural and underserved communities where internet infrastructure is limited or unreliable. Its autonomous, device-level processing ensures privacy and uninterrupted operation without dependency on cloud services. Ideal for schools, learning centres, or home-based education, the system bridges the digital divide by offering an inclusive and adaptive learning solution that empowers students with limited access to traditional educational resources.

(57) Abstract :

The present invention relates to a system and method that integrates Internet of Things (IoT) and Artificial Intelligence (AI) technologies to detect animal movement and provide timely alerts to drivers on forest highways, aiming to prevent wildlife-vehicle collisions. The system employs a network of strategically placed IoT sensors, including thermal, infrared, motion, and acoustic sensors, to continuously monitor animal activity near roadways. Data collected from these sensors is transmitted wirelessly to an AI-powered processing unit, which analyzes patterns and classifies detected objects using advanced machine learning algorithms. When an animal is identified within a potential collision zone, the system generates real-time alerts, which are relayed to drivers via digital roadside signage, in-vehicle alerts, or mobile notifications. This proactive approach enhances driver awareness and safety while reducing the impact on wildlife. The system also incorporates a feedback mechanism for continuous learning and improvement.

(57) Abstract :

Abstract The findings reveal that informativeness, interaction, and electronic word-of-mouth positively influence perceived value, while customization does not have a significant effect. Perceived value, in turn, positively affects trust and social identity, which subsequently enhance purchase intentions. These results underscore the importance of strategic social media marketing in shaping consumer perceptions and behaviors toward organic products. Marketers are encouraged to focus on delivering informative content, fostering interactive engagement, and leveraging electronic word-of-mouth to build trust and strengthen social identity, thereby influencing purchase intentions. This invention contributes to the understanding of the mechanisms through which social media marketing influences consumer behavior in the organic products sector and offers practical insights for marketers aiming to enhance their strategies in this domain.

(57) Abstract :  
ABSTRACT This study presents an AI-driven multi-modal fusion model that integrates synthetic medical images with electronic hospital records (EHRs) and blood reports for comprehensive liver diseases diagnostics. The methodology integrates Vision Transformers for medical image feature extraction, TF-IDF for clinical text processing, and XGBoost for classification, achieving 84% overall accuracy, 85% weight F !-score. A Liver-Specific Large Language Model further enhances explainability and treatment recommendations. The system effectively identifies 23 liver conditions with precision rate ranging from 85-93%. This research demonstrates the potential of AI to improve liver disease diagnostics through advanced cross-attention fusion mechanisms, highlighting the clinical implications of integrating multi-modal learning into hospital decision-support systems. ~◆◆

(57) Abstract :  
This project presents the design and development of a multi-utility vehicle concept featuring a detachable passenger unit aimed at enhancing transportation flexibility and functionality. The proposed prototype allows seamless detachment and reattachment of the passenger cabin, enabling its use across diverse applications such as public transport, emergency services, and rural mobility. The modular design ensures efficient space utilization, cost-effective deployment, and quick adaptability to varying operational needs. Emphasis is placed on structural stability, ease of detachment, and safety of occupants during transitions. This concept introduces a scalable mobility solution that aligns with evolving urban and semi-urban transport demands, offering a sustainable and versatile alternative to conventional vehicles. The prototype serves as a foundation for future innovations in modular transport systems.

(57) Abstract :

IOT & MACHINE LEARNING ENHANCED INTRUSION DETECTION SYSTEM WITH ADAPTIVE THREAT PATTERN RECOGNITION ABSTRACT The invention presents a Machine Learning-based Intrusion Detection System optimized for IoT networks with adaptive threat pattern recognition capabilities. It utilizes a hybrid architecture combining local anomaly detection on IoT devices with a centralized, continuously learning classification model. By leveraging unsupervised learning at the edge and supervised learning at the core, the system identifies evolving cyber threats, including zero-day attacks. The model is updated through federated learning for decentralized privacy- preserving adaptation. Designed for constrained environments, the IDS ensures real-time, accurate, and scalable intrusion detection across heterogeneous IoT systems. It enhances protection for smart infrastructure, healthcare, and industrial IoT deployments through adaptive intelligence and behavioral analysis.

(57) Abstract :

The invention discloses a refrigeration-based method for separating a component from a mixture of solvents by leveraging differences in their freezing points. The process involves cooling the solvent mixture in a controlled refrigeration unit to a temperature where the target component with the highest freezing point solidifies, while other solvents remain in the liquid phase. The solidified component is then isolated through filtration or decanting, yielding high-purity results. This method offers a sustainable, energy-efficient alternative to conventional techniques like distillation or chemical extraction, which often involve high energy costs or environmentally harmful reagents. The process is scalable, cost-effective, and particularly effective for separating solvents with similar boiling points, making it suitable for applications in pharmaceuticals, petrochemicals, and food processing. By minimizing energy consumption and eliminating chemical reagents, the invention provides an environmentally friendly solution, enhancing process efficiency and product purity in industrial solvent separation

(57) Abstract :

The railway accidents from derailments or obstruction pose a major threat to the safety in railways. This paper discusses the Railway Track Detection System with Obstacle Avoidance comprising an ESP32 microcontroller, ultrasonic sensors, infrared (IR) sensors, the NEO-6M GPS module, the L298N motor driver, and an LCD display aimed at increasing the monitoring and safety of railway tracks in real time. This system will be designed to detect the railway track with the help of IR sensors while detecting obstacles using ultrasonic sensors. The NEO-6M GPS module provides a live and perfect location tracking to have real-time monitoring of its movement. With the use of a mobile application, this data can be made available for remote monitoring and alarms. For testing purposes, using an L298N motor driver small-scale railway vehicle gets automated control by driving on its routes, with an ending condition that is when the obstacle is detected. Whenever an object or obstacle in the path of the so-called mini version of the railway vehicle is detected, the alert gets switched on, stop the vehicle, and notify to the monitoring application. Thus, real-time obstacle detection and track monitoring make enhancement of railway safety much more cost-effective with IoT techniques.

(57) Abstract :  
A system (100) for selecting and managing digital colors using a hue-value-chroma (HVC) model comprises a user device (102) communicatively connected to a color processing engine (104) via a network (106). The processor (114) within the engine receives color inputs through a 10n color picker (118), allowing selection of hue (0°–359°), value (0%–100%), and chroma (0%–100%). A color conversion engine (120) translates colors between HVC and RGB, HEX, or HSL. A grid generation engine (122) creates a chroma–value grid per hue, and a pixel analysis engine (124) extracts HVC from image pixels. A palette generation engine (126) forms harmonized palettes, while a customization engine (128) enables user control over direction, structure, and locking. The system (100) empowers digital artists with precision, flexibility, and compatibility across color formats for enhanced creative workflows.

(57) Abstract :

The present invention discloses a method for preparing collagen scaffolds using the collagen isolated from the fins and tails of spotted seer fish collagen (Scomberomorus guttatus). With asymmetric pores and moisture content of 9.84%. The porosity and contact angle of collagen scaffold was determined as 83.3% and 79°. The collagen scaffold was found to be cytocompatible and non-hemolytic when treated with NIH3T3 fibroblasts and human red blood cells. The collagen scaffold can be used for various biomedical applications such as tissue regeneration, wound treatment, and drug delivery.

(57) Abstract :

The present invention relates to the development of a corrosion-resistant metal matrix composite (MMC) suitable for marine applications. The MMC comprises an AlMgSi aluminum alloy reinforced with micron-sized Yttria-Stabilized Zirconia (YSZ) particulates, fabricated via a novel three-stage mechanical stir casting technique to ensure homogeneous dispersion and interfacial bonding. To further enhance corrosion resistance, the MMCs are coated with a green-synthesized ternary metal oxide (Co<sub>3</sub>O<sub>4</sub>-NiO-Al<sub>2</sub>O<sub>3</sub>) layer comprising cobalt oxide (Co<sub>3</sub>O<sub>4</sub>), nickel oxide (NiO), and aluminum oxide (Al<sub>2</sub>O<sub>3</sub>). The ternary oxide coating is synthesized using an eco-friendly solution combustion method, wherein the aqueous leaf extract of Hibiscus rosa-sinensis serves as a green fuel, complexing agent, and bio-template. The resulting nanostructured oxide layer forms a dense, adherent, and multifunctional passive barrier that significantly improves resistance to localized and uniform corrosion by impeding ionic diffusion and suppressing electrochemical reactions at the metal-electrolyte interface. Comparative corrosion assessments comprising electrochemical impedance spectroscopy (EIS), potentiodynamic polarization, and immersion tests will be conducted on four material conditions: (i) base AlMgSi alloy, (ii) coated AlMgSi alloy, (iii) YSZ-reinforced MMC, and (iv) coated MMC. The invention offers a sustainable, high-performance material solution for components exposed to aggressive saline environments, such as those encountered in shipbuilding and offshore structures.

(57) Abstract :

The T/2 Caliper is an innovative orthodontic instrument engineered to enhance the precision and ease of measuring overjet, overbite, and maximum mouth opening. Traditional measurement techniques often rely on standard rulers or periodontal probes, which can cause patient discomfort and introduce measurement inaccuracies. The T/2 Caliper addresses these limitations with a dual-segment, L-shaped design that allows seamless sliding of its smaller segment along the larger one, ensuring accurate contact with the incisal tips of the maxillary and mandibular anterior teeth. Both segments are equipped with clearly marked measuring scales; the primary scale measures overjet and overbite, while the secondary scale, located on the reverse side, is specifically calibrated to measure maximum mouth opening. This versatile design also accommodates the measurement of open bites and reverse overjet's by providing both positive and negative value readings, a feature that enhances its diagnostic capabilities. Manufactured using high-precision 3D printing technologies and biocompatible resins, the T/2 Caliper guarantees durability and optimal clinical performance. Its ergonomic structure minimizes patient discomfort during evaluations, while its accuracy facilitates reliable documentation of orthodontic case histories. By streamlining the process of vertical height assessment, the T/2 Calliper advances the standard of care in orthodontics, offering clinicians a robust tool for diagnosing malocclusions and formulating effective treatment plans.

(57) Abstract :

Abstract The Automated Seed Sowing Machine is an innovative solution aimed at addressing the inefficiencies of traditional seeding methods in agriculture. Conventional sowing operations often require significant labor, time, and cost due to manual effort and reliance on hired machinery. These methods also suffer from uneven seed distribution, increased operational time, and reduced planting efficiency. This machine is manually operated but ergonomically designed to significantly reduce the physical effort of farmers, enhance precision in seed and fertilizer placement, and minimize overall cost. It is engineered to be compatible with various farm types and a wide range of crops, featuring a robust, durable, and farmer-friendly construction. By streamlining the sowing process, the machine supports increased agricultural productivity while preserving soil structure and reducing dependency on external labor or high-end mechanized equipment. It represents a practical step toward the modernization of small and medium-scale farming, contributing to sustainable and efficient agricultural practice.

(57) Abstract :

ABSTRACT: Title: An Adaptive Road Barrier System and Method for Traffic Control and Emergency Vehicle Recognition The present disclosure proposes an adaptive road barrier system (100) that dynamically regulates traffic flow, enforces signal compliance, facilitates emergency vehicle clearance, and enhances road safety under varying environmental conditions. The adaptive road barrier system (100) comprises an automated traffic barrier unit (102), a speed detection unit (106), a first capturing unit (108), a weather sensor (110), a second capturing unit (112) and a computing device (114). The proposed system (100) is scalable and easily deployable due to its modular design, thereby making it adaptable to urban roads, highways, toll booths, and private premises. The proposed system (100) integrates with smart city projects, aligns with modern urban development strategies, making it a highly marketable solution for municipal governments and smart infrastructure providers.

(57) Abstract :  
ABSTRACT: Title: Battery Management System with Integrated Grid Sensing, Power Conditioning, and Secure Control Features The present disclosure proposes a battery management system (BMS) (100) with integrated grid failure sensing, secure operational control, multi-source power regulation, and robust data integrity features, thereby enabling reliable and efficient energy storage management for grid-interactive and backup power applications across both low-voltage and high-voltage battery configurations. The battery management unit (BMS) (100) comprises a battery pack (102), and a battery management unit (BMU) (104). The battery management system (BMS) (100) autonomously detects grid loss via an internal opto-isolated sensing circuit and transitions seamlessly into backup mode without external relays or controllers, thereby improving reliability and reducing system complexity. The BMS (100) integrates with cryptographic security, an independent real-time clock, and non-volatile memory to support secure authentication, time-stamped event logging, and persistent data storage during connectivity outages or power failure events.

(57) Abstract :  
Exemplary embodiments of the present disclosure are directed towards a system for AI-based predictive visualization and personalized transformation using biometric and goal data. The system comprises a computing device including a processor, memory, and image capturing unit. A transformation monitoring module is configured to receive a biometric image and physiological parameters such as age, weight, height, gender, and lifestyle data. The biometric image is preprocessed to normalize resolution, scale, and format, and the physiological parameters are validated before transmission to a cloud server. The cloud server comprises a transformation analysis module configured to analyze the current biometric profile using historical data and predict future biometric states through a trained machine learning model. A visual representation and associated metrics of the predicted state are generated and transmitted to the computing device. The transformation monitoring module displays the output via a graphical user interface to enable AI-driven visualization and goal-aligned transformation plan. FIG. 1

(57) Abstract :

ABSTRACT OF THE INVENTION The present invention relates to a smart cancer detection system that leverages multi-modal image fusion and adaptive deep learning for accurate and efficient cancer diagnosis. The system integrates medical images acquired from diverse modalities, including histopathology and mammography, to create enriched composite images through an integrated image fusion and preprocessing module. An adaptive deep learning model analyzes these images, learning complex patterns and features associated with cancerous tissues. A feature extraction and patient context matching module correlates image-derived features with patient-specific clinical data to support personalized risk assessment. The system further includes a classification and prediction unit that generates diagnostic outcomes, supported by a hybrid cloud analytics and edge processing framework for scalable and low-latency operations. A security and encryption layer ensures the safe handling and transmission of sensitive diagnostic data, providing outputs via mobile apps, physician dashboards, and EMR integration .. This invention offers a robust, secure, and adaptive solution for early cancer detection, improving diagnostic accuracy and supporting clinical decision-making.

(57) Abstract :

ABSTRACT OF THE INVENTION The present invention relates to an agricultural pest monitoring system enhanced with deep learning for real-time pest detection and management. The system utilizes an image acquisition unit comprising cameras and sensors to capture field images under varying environmental conditions. Captured images are preprocessed to enhance quality before being analyzed by a deep learning-based pest detection module employing convolutional neural networks for accurate pest identification. Post-processing modules refine detection results, eliminating false positives and generating confidence scores. A decision support system evaluates infestation severity and recommends targeted pest management strategies. Alerts and notifications are delivered to users via SMS, mobile apps, or dashboards, while a cloud storage and continuous learning module enables adaptive model improvement, ensuring long-term accuracy and scalability of the system.

(57) Abstract :

A thermal management system 100 for a storage tank 102 to hold temperature-sensitive liquids includes an inner storage chamber 202, a double-walled outer shell 212, and a honeycomb-structured mesh 206 in between, containing a thermal regulation system 120 for passive thermal buffering and stability. A water-based cooling system 104 sprays water over the outer shell 212, enabling gravitational flow through the mesh 202 to enhance evaporative cooling. A heat modeling system 112 maps real-time surface temperatures using infrared radiation to dynamically adjust cooling at hot spots. A photovoltaic-electrochromic envelope system 122 autonomously adjusts reflectivity based on sunlight intensity to reduce solar heat gain. Ultrasonic transducers 124 generate localized micro-vibrations in the mesh 206 to improve heat transfer. For fire safety, the system 100 includes a fire-resistant coating on inner chamber 202, a gas-based suppression unit 128 activated under extreme heat, and wireless connectivity 130 for remote monitoring and integration with external firefighting systems.

(57) Abstract :

The present disclosure relates to a system (100) including a structural imaging module 102 that uses Acoustic Resonance Spectroscopy (ARS) to analyze mechanical and structural properties of arterial walls for identifying abnormal tissue regions. A molecular imaging module 104 containing Magneto-Plasmonic Resonance Imaging (MPRI) nanoparticles configured to attach to specific biological markers in atherosclerotic plaques, enabling detailed molecular-level imaging. A wearable biosensor module 106 continuously monitors cardiovascular health indicators. Additionally, a photoacoustic imaging (PAI) module 108 captures detailed images of fatty lipid-rich plaques by detecting light absorption by lipids and converting it into acoustic signals. A processing unit 110 collects data from all modules, combining structural, molecular, and systemic information to generate a comprehensive representation of arterial health. The processing unit 110 applies machine learning algorithms to detect and classify arterial blockages, producing a diagnostic output.

(57) Abstract :  
Funicular concrete shells represent a class of geometrically optimized structural elements that achieve high strength and stiffness through form-active behavior, primarily resisting applied loads via compressive stress paths. This invention investigates the influence of rise height on the load-carrying capacity and deflection behavior of shallow funicular concrete shells cast over square ground plans using M25 grade concrete. The primary objective is to establish an experimentally validated framework for rise-based optimization in funicular shell design. A total of four prototype shells were developed with fixed plan dimensions (50 cm × 50 cm) and varying rise values: 0 cm, 6 cm, 9.5 cm, and 12 cm. Shell geometry was generated using a sag-based mold technique involving a flexible foam (rexine) stretched across a steel frame. This method ensured consistent funicular shapes and efficient casting. Reinforcement was provided in both directions, along with integrated edge beams to replicate realistic boundary conditions. The fabricated shells were subjected to central point load testing to analyze the mechanical response, including initial crack formation, ultimate load capacity (Pu), and vertical deflection. The results indicate that shells with higher rises exhibit significantly better structural performance. The ultimate load capacity was found to increase with rise, while central deflection decreased, confirming that geometrical rise contributes to improved stiffness and failure resistance. Shells with lower rises showed brittle failure and concentrated cracking, whereas higher-rise shells displayed distributed cracking and delayed failure, indicative of more ductile behavior. Through the comparison of performance metrics across different shell configurations, the invention establishes a correlation between rise height and load capacity, forming the basis for a rise-to-performance optimization model. This study also proposes an empirical expression relating Pu and rise-to-span ratio, which can be used as a design aid for engineers and architects. In conclusion, this invention presents a cost-effective, repeatable, and experimentally verified methodology for the construction and performance assessment of funicular concrete shells. It demonstrates the value of rise manipulation as a design variable to enhance the structural behavior of shell systems without increasing material use. The findings support applications in precast modular systems, lightweight roofing structures, and architecturally exposed concrete (AEC) elements, promoting material economy and structural efficiency in civil engineering practices.

## (57) Abstract :

The present disclosure provides a nanozyme-based electrochemical sensor (100) for enhanced glutathione detection through enzyme-mimicking catalytic activity. The sensor includes copper selenite nanoparticles (103) with monoclinic crystal structure and functionalized carbon nanofibers (104) forming a nanocomposite (105), integrated with a glassy carbon electrode (107) for electrochemical measurement. The system enables selective detection through specific interaction between Cu(II) coordination sites and glutathione thiol groups, facilitated by superoxide dismutase-mimicking mechanism that catalyzes glutathione oxidation. Unlike conventional enzyme-based sensors affected by stability issues and narrow detection ranges, this integrated approach achieves unprecedented linear range from 0.0625  $\mu\text{M}$  to 7785.0  $\mu\text{M}$  through synergistic nanoparticle-nanofiber interaction. Real-time electrochemical detection at optimized potential of 0.29 V enables accurate glutathione quantification with detection limit of 0.0176  $\mu\text{M}$ , demonstrating 97.35-99.15% recovery in biological samples and maintaining over 95% activity after 15 days.

(57) Abstract :  
Enhancing HR efficiency: AI-driven employee satisfaction, attrition prediction is the proposed invention. HR management by providing real-time insights into employee engagement and identifying potential attrition risks. Using natural language processing (NLP) and machine learning, the system offers a dual approach: classifying employee feedback to reveal sentiment trends and predicting attrition risk based on personal and organizational factors. This integrated solution supports HR professionals by proactively analyzing employee feedback and flagging high-risk cases for attrition, enabling more informed and timely actions. Unlike existing tools that often lack personalization and rely on retrospective data, this system delivers actionable insights, helping to create a more supportive workplace and reduce voluntary turnover. By enhancing both employee satisfaction and organizational stability, this project presents a new level of data-driven decision-making in HR.

(57) Abstract :

Fabrication and development of three position adjustable riding system is the proposed invention. Fabrication and Development of three position adjustable riding system Motorcycle riders often experience discomfort and fatigue during long-distance rides due to the fixed and non-adjustable nature of standard seats and handlebars. The inability to adjust these components limits the rider's ability to shift positions and adapt to varying riding conditions, leading to poor ergonomics, increased strain on the body, and diminished comfort. The result is not only reduced endurance but also a less enjoyable and potentially unsafe riding experience. Traditional seats and handlebars, while functional, do not cater to the diverse needs of riders with different body types, preferences, or riding styles.

(57) Abstract :

The present invention relates to a novel, intelligent surveillance solution that leverages advanced deep learning techniques for the purpose of real-time anomaly detection in video footage, specifically designed for deployment on edge devices. In an era where surveillance systems generate voluminous visual data, centralized processing methods—such as cloud-based analysis—pose significant challenges, including high latency, substantial bandwidth usage, vulnerability to network disruptions, and compromised data privacy. The proposed invention addresses these issues through the development of an edge-optimized, lightweight deep neural network (DNN) architecture tailored for constrained environments like embedded systems and low-power edge devices. The core contribution of this invention lies in its ability to detect anomalies—such as violent acts, intrusions, accidents, or unusual behavior patterns—in live surveillance feeds without the need for constant cloud connectivity. To achieve this, the neural network is architected with a balance between performance and efficiency, incorporating multiple optimization strategies. These include network pruning, which systematically eliminates redundant parameters; quantization, which reduces model precision to compress size and improve inference speed; and knowledge distillation, a method wherein a compact “student” model learns from a more accurate, computationally expensive “teacher” model. In addition to architectural design, the invention integrates spatio-temporal feature extraction using hybrid modules that combine lightweight convolutional neural networks (CNNs) and temporal analysis through recurrent layers such as Long Short-Term Memory (LSTM) units. Attention mechanisms are also embedded to prioritize critical features relevant to detecting irregularities in the scene, thus enhancing interpretability and detection precision. Moreover, the proposed framework facilitates on-device processing that significantly reduces reliance on internet connectivity and backend servers, thereby improving system robustness, enabling low-latency alerts, and enhancing data confidentiality by processing footage locally. It is particularly suitable for deployment in smart cities, public safety environments, industrial monitoring systems, and remote areas where network infrastructure may be limited or unreliable. Through extensive experimentation and real-world testing, the lightweight model has demonstrated its capability to maintain high anomaly detection accuracy while achieving real-time inference speeds on various edge platforms, such as Raspberry Pi, NVIDIA Jetson Nano, and Google Coral. This makes the invention a highly practical and scalable solution for next-generation surveillance systems.

(57) Abstract :  
ABSTRACT SYSTEM AND METHOD FOR EXTRACTING SEMANTICALLY RICH METADATA FROM MULTIMEDIA AND ENABLING CROSS-MODAL SEARCH The present disclosure relates to an integrated media management system (100) for extracting semantically rich metadata from heterogeneous multimedia content and enabling cross-modal semantic search. The system (100) includes an ingestion module (102) to receive images, documents, and audio files, and a multimodal processing module (104) comprising an image analysis unit (104A), a document parsing unit (104B), and an audio interpretation unit (104C) for media-specific analysis and summarization. A metadata structuring module (106) converts the processed outputs into structured metadata. The storage module (108) persistently stores both media and metadata. A semantic indexing module (110) transforms metadata into embeddings for a cross-modal vector index. A query engine (112) receives natural language queries, computes similarity scores against indexed content, and retrieves relevant results. A user interface module (114) displays the matched content with contextual metadata in an interactive dashboard, allowing users to perform efficient, semantically aware searches across diverse media formats.

(57) Abstract :

Fabrication and development of a multi purpose agricultural machine for weeding and solid fertilizer distribution is the proposed invention. In this modern era, weeding with simple tools such as cutlass, hoe etc. is labor intensive and time consuming. Thus, there is a need for the design of manually operated weeder for intensive and commercial farming system in India. One of the problems in crops and vegetables production is poor weed control; hence there is need of mechanical weeder to increase the production of these products. The cost for employing a Labor force when using simple tools is very high in commercial farming system. This can be reduced using mechanical weeder. The aim of the paper is to design, construct and test manual weeder, to provide the best opportunity for the crop to establish itself after planting and to grow vigorously up to the time of harvesting.

(57) Abstract :

The invention provides a real-time plant disease detection system for autonomous use in agricultural fields, integrating a mobile hardware platform and edge-based software algorithm. The system features a wheeled chassis (106) with navigation, environmental and image sensors (101), a microcontroller (102) capable of executing machine learning inference, an edge computing module, and a power supply (103), all enclosed for field deployment. Data collected is processed locally using a custom-trained neural network developed in Edge Impulse Studio, enabling low-latency, offline disease diagnosis. The software is optimized for on-device inference and supports incremental learning to adapt to new crops and disease patterns. A user interface dashboard visualizes results and supports field decisions. This integrated system reduces reliance on manual inspection or internet connectivity, offering a scalable, energy-efficient solution for precision agriculture and timely crop health management.
