PUBLICATION OF THE PATENT OFFICE

## **INTRODUCTION**

In view of the recent amendment made in the Patents Act, 1970 by the Patents (Amendment) Act, 2005 effective from 01<sup>st</sup> January 2005, the Official Journal of The Patent Office is required to be published under the Statute. This Journal is being published on weekly basis on every Friday covering the various proceedings on Patents as required according to the provision of Section 145 of the Patents Act 1970. All the enquiries on this Official Journal and other information as required by the public should be addressed to the Controller General of Patents, Designs & Trade Marks. Suggestions and comments are requested from all quarters so that the content can be enriched.

Under the new provision of the Patents Act, 1970 as amended by the Patents (Amendment) Act, 2005 and Rules there under, Publication of the matter relating to Patents in the Official Gazette of India Part III, Section 2 has been discontinued and instead The Official Journal of the Patent Office is being published containing all the activities of The Patent Office such as publication of all the patent applications after 18<sup>th</sup> months , grant of patents & all other information in respect of the proceedings as required under the provisions of the Patents (Amendment) Act, 2005 and Rules thereunder on weekly basis on every **Friday**.

The Journal is uploaded in the website every Friday. So Paper form and CD-ROM form of the Journal are discontinued from 01/01/2009.

## **SPECIAL NOTICE**

Every effort is being taken to publish all the patent applications under section 11(A) of the Patents Act. However, if duplication of publication of any application is found, then earlier date of publication will be taken for the purpose of provisional protection for applicant and Patent Office will grant Patent not before six months from the date of second publication, provided that there is no third party representation.

## **CORRIGENDUM**

### **(PATENT, KOLKATA)**

Patent application no. 202531043919 was published under Section 11-A(2) of The Patents Act read with Rule 24-A of The Patents Rules in the Official Journal No. 20 of 2025 dated 16<sup>th</sup> May 2025, wherein the name of the fourth applicant was inadvertently mentioned as “**Dr. Sumi Kankara Dewan**”. However, the correct name of the fourth applicant is “**Dr. Sumi Kankana Dewan**”. Therefore, it is hereby notified that the name of the fourth applicant as published in the Official Journal No. 20 of 2025 dated 16<sup>th</sup> May 2025 shall be read as “**Dr. Sumi Kankana Dewan**”.

## **CORRIGENDUM**

### **(PATENT, KOLKATA)**

Patent application no. 202531050429 was published under Section 11-A(2) of The Patents Act read with Rule 24-A of The Patents Rules in the Official Journal No. 24 of 2025 dated 13<sup>th</sup> June 2025, wherein the name of the first applicant was inadvertently mentioned as “**Dr. Sumi Kankara Dewan**”. However, the correct name of the first applicant is “**Dr. Sumi Kankana Dewan**”. Therefore, it is hereby notified that the name of the first applicant as published in the Official Journal No. 24 of 2025 dated 13<sup>th</sup> June 2025 shall be read as “**Dr. Sumi Kankana Dewan**”.

## **CORRIGENDUM FOR CORRECTION IN PATENT OFFICE JOURNAL**

APPLICATION NO. 202541033343 published in Patent Office Journal no. 17/2025 dated 25/04/2025, the address of the applicant/inventor should read as follows:

### **ADDRESS OF APPLICANT/INVENTOR:**

DEPARTMENT OF PHARMACOLOGY, KLE COLLEGE OF PHARMACY, JNMC CAMPUS, KAHER, NEHRU NAGAR, BELAGAVI BELAGAVI  
KARNATAKA INDIA 590010.

## Early Publication:

The following patent applications have been published under section 11A (2) of The Patents (Amendment) Act 2005 and rule 24A of The Patents (Amendment) Rules, 2006. Any person may file representation by way of opposition to the Controller of Patents at the appropriate office against the grant of the patent in the prescribed manner under section 25(1) of the Patents (Amendment) Act 2005 read with the rule 55 of The Patents (Amendment) Rules, 2006:

(57) Abstract :

The present invention relates to a communication system and a method thereof. Further, the system (100) comprises one or more measuring devices connected to a server (104) via a communication network (106). Further, each measuring device from the one or more measuring devices comprises a network interface card (NIC). Further, the NIC comprises a first communication interface and a second communication interface. Further, the first communication interface is configured to connect a measuring device from the one or more measuring devices to the server (104). Furthermore, the second communication interface is configured to connect the measuring device from the one or more measuring devices to a user device. [To be published with Fig. 4]

(57) Abstract :

This invention relates to an advanced signaling system ·designed specifically to enhance road safety by minimizing the chances of accidents during U-turns and overtaking maneuvers. The proposed equipment integrates indicators to provide precise and clear communication of the driver's intentions to surrounding vehicles.

(57) Abstract :  
The present invention provides a shock detection and dynamic adjustment system for vehicles that enhances ride quality and handling by automatically responding to road irregularities. The system comprises optical displacement sensors to monitor tire movement, a motor-driven adjustment mechanism for real-time suspension modifications, and an AI-driven predictive module that anticipates shocks and adjusts vehicle dynamics preemptively. A square offline mechanism constrains the motor-driven system within defined spatial limits, while an emergency braking interface activates when collision risks are detected. The system also includes speed monitoring, power management, and user-adjustable sensitivity settings. By integrating these components, the invention provides a comprehensive solution for real-time shock detection and adjustment, ensuring improved vehicle stability, comfort, and safety across varying road conditions.

(57) Abstract :

The present invention relates to a device that employs a mouse-like sensor system designed to capture and analyze surface textures, automate precise movements, and maintain consistent functionality across various surfaces. The device integrates advanced optical and tactile sensors with machine learning algorithms to dynamically interpret texture data and adjust its movement responses in real time. A modular hardware architecture supports scalability and adaptability, comprising, in some embodiments, a sensor module, processing unit, control unit, and actuation module. A novel algorithm maps surface texture patterns and informs control responses to enable smooth and accurate motion. The invention enables consistent and intelligent performance of automated movements, regardless of surface variation.

(57) Abstract :

The present invention relates to an autonomous drone-based system for integrated pest control, animal deterrence, and security surveillance in agricultural environments. The system consists of a multi-rotor or fixed-wing drone equipped with a high-resolution camera, thermal imaging sensor, GPS, inertial measurement unit (IMU), and obstacle detection sensors. A high-performance onboard AI processor executes deep learning models including CNN and YOLO to detect and classify harmful insects, warm-blooded animals, and unauthorized human presence in real time. A precisely calibrated Class 4 laser system, integrated with AI-based target locking, enables selective insect elimination and configurable low-power pulsing for non-lethal deterrence of animals and humans. The system is powered by a lithium polymer battery with smart power management, and includes a solar charging dock for sustainable operation. Autonomous navigation, real-time obstacle avoidance, geo-fencing, and emergency safety protocols are included to ensure precision, safety, and operational reliability across diverse agricultural zones.

(57) Abstract :

The invention discloses a mobile-controlled ball mill system integrated with an electronic Hall effect characterization module for real-time evaluation of material properties. The apparatus consists of a milling chamber driven by a variable-speed brushless or stepper motor, controlled through a wireless IoT interface 6 linked to a mobile application. Users remotely set and monitor parameters including rotational speed, milling time, and internal temperature or vibration. Post-milling, a portion of the processed material is directed into an adjacent Hall effect characterization unit featuring a Hall bar substrate 10, magnetic field source 11, voltage probes 12, and a programmable current supply. Real-time measurements of Hall voltage, resistance, and carrier mobility are acquired and transmitted to the mobile interface 7 and cloud database. The system provides integration of mechanical grinding and electrical property measurement in a portable, automated platform, suitable for academic, industrial, and field-based applications. The invention provides reproducibility, reduces contamination, and simplifies material analysis workflows.

(57) Abstract :

A device for generating real-time holographic projections of a person includes four spatially arranged imaging cameras positioned around a laptop, depth mapping sensors, a processing unit with machine learning-based 4D motion capture algorithms, and a holographic projection module. The cameras capture synchronized image data from multiple angles while depth sensors detect distance and surface information. The processing unit analyzes this data in real-time to generate a dynamic three-dimensional representation including body pose, facial expressions, and micro-movements. The holographic module projects this representation using optical elements and operates with a modular data flow architecture for latency-minimized rendering. The system features a tetrahedral camera configuration, structured light and time-of-flight sensing, convolutional neural networks for motion capture, and Fourier transform-based light field synthesis. Additional components include a temporal smoothing module, microlens array, tunable laser array, calibration module, and thermal management mechanisms, enabling realistic, interactive holographic telepresence.

(57) Abstract :

The present disclosure relates to a method of production of xylitol from corn sheath. The method comprises three phases viz., Isolation of hemicellulose from corn sheath, conversation of hemicellulose in xylitol and purification of the xylitol. The said method results in xylitol yield of 67.68 per cent and colour value (?E) of 32.03.

(57) Abstract :

Present invention discloses a method for quantification and detection of strabismus using deep learning and ocular landmark detection. The method involves data collection by capturing images of patients using 12MP smartphone camera, preprocessing images by auto-orientation, resizing to 640×640 and segmentation to extract eye region from images, splitting data into training, validation and test sets in 70:15:15 ratios, data augmentation by flipping, rotation to range of -5° to +5° and adjusting brightness between -20% to +20%, binary classification of eye conditions as "normal" or "abnormal" using YOLOv8, applying a multiclass classification approach using ResNet-101 to categorize strabismus into esotropia, exotropia, hypertropia, and hypotropia, detecting ocular landmarks using ResNet-18 to identify key anatomical points including medial canthus, lateral canthus, and pupil center, computing ocular deviations based on pupil displacement indices and angular deviation calculations and quantifying strabismus severity using a regression model to estimate deviation angles, ensuring objective and reproducible results.

(57) Abstract :

The present invention relates to a low-cost torrefied municipal solid waste (MSW) with enhanced fuel properties. The torrefied MSW is produced through oxidative torrefaction for the treatment of municipal solid waste in an auger reactor as an alternative energy source to fossil-based coal. The produced torrefied MSW has enhanced calorific value and energy density as well as reduced chlorine and sulfur content than that of raw MSW as well inert torrefied MSW. This process employs the combustion of volatiles released from MSW during the process and provides the heat thereby eliminating the external heat required for torrefaction. To be Published with Figures 1 and 2

(57) Abstract :

The present invention relates to a efficient synthetic method for the preparation of hybrid compounds comprising quinoline and 1,2,3-triazole moieties linked via a methyl ether bridge Formula (I). The method involves the initial formation of a 6,7-dimethoxy-4-(prop-2-yn-1-yloxy) quinoline intermediate, followed by a Cu(I)-catalyzed azide-alkyne cycloaddition (click reaction) with various aryl azides under mild, aqueous conditions. The process yields a library of structurally diverse triazole-linked quinoline derivatives with high purity and excellent yields. These compounds exhibit potential as inhibitors of vascular endothelial growth factor receptor 2 (VEGFR-2) and are thereby proposed as candidate agents for breast cancer therapy. The invention further provides pharmaceutical compositions comprising said compounds and their use in the treatment of cancer.

(57) Abstract :  
Disclosed is a system (100) for plaque segmentation in intravascular ultrasound (IVUS) images. The system includes a user device (102), a communication network (106), and an information processing apparatus (104). The information processing apparatus includes processing circuitry (108) configured to: acquire IVUS images; preprocess the images; initialize a machine learning model including an encoder, dual decoders, and a discriminator; train the model on labeled data (308); encode unlabeled images; select informative unlabeled samples (312); extract labels for selected samples (314); add newly labeled samples to training data (316); retrain the model (318); generate plaque segmentation masks (320); and evaluate segmentation performance (322). The system iteratively improves model performance by incorporating newly labeled data and refining the training process. FIG. 1 is selected

(57) Abstract :

The present invention discloses a modular handbag system (100). The modular 5 handbag system (100) comprising a base bag with fixed internal compartments for storing user essentials, and a plurality of interchangeable outer shells (102) including front, back, bottom panels, and one or more handles. The outer shells (102) are detachably connected to the base bag using a three-point attachment mechanism with dual zippers (106) on lateral sides and a Velcro strip (104) along 10 the top edge. The outer shells (102) are foldable, reducing to at least 20% of their expanded volume for compact storage. Handles are detachable and interchangeable, supporting various carrying options. The system maintains internal organization without transferring items. Sustainable materials such as recycled polyester and plant-based leather are used. Additionally, a shell recycling program enables eco-15 conscious replacements, supporting long-term durability and environmental responsibility. Figure 1 will be the reference

(57) Abstract :

The present invention relates to a herbal composition comprising extracts of Syzygium cumini stem bark, Phyllanthus fraternus leaves, and Urtica dioica root for the prevention and management of kidney stones (nephrolithiasis). The extracts are obtained using Soxhlet extraction and evaluated through in vitro assays, demonstrating significant inhibition of calcium oxalate crystal formation, nucleation, and aggregation. Molecular docking identified ellagic acid, methyl brevifolincarboxylate, and neoolivil as key active constituents with high affinity toward the renal calcium-sensing receptor. The composition is formulated into a 600 mg oral capsule and shown to be non-toxic in HepG2 cell lines and stable under accelerated conditions. The invention offers a safe, natural, and effective alternative to conventional therapies for managing kidney stone disease.

(57) Abstract :

Embodiments herein disclose an antenna system (100) for a wireless communication system, including a top layer (102), a ground layer (106), and a bottom layer (112). The top layer (102) includes at least one antenna slot array (114) in the center of the top layer (102). The ground layer (106) includes at least two coupling apertures (124, 126) for dual-polarization. At least two grounded coplanar waveguide (GCPW) feedlines (128) for the at least one antenna slot (114) are printed on the bottom layer (112). The top layer (102) and the ground layer (106) is separated by a first dielectric substrate (104). The ground layer (106) and the bottom layer (112) is separated by a second dielectric substrate (108) and a bonding film (110). FIG. 1A

## (57) Abstract :

The present disclosure proposes a biodegradable nano-encapsulation system designed for the controlled and targeted delivery of botanical-based pesticides. The biodegradable nano-encapsulation system for the controlled delivery of botanical-based pesticides comprises one or more plant-derived bioactive compounds. and a nanocarrier matrix. The proposed system offers an eco-friendly and effective alternative to conventional synthetic pesticides. The proposed system encapsulates the plant-derived bioactive compounds within the biodegradable and non-toxic nanocarriers for agricultural pest control. The proposed system protects the active pesticidal agents from environmental degradation factors, such as UV radiation, high temperatures, oxidation, and moisture, thereby enhancing their shelf life and field stability. The proposed system ensures in prolonged pest control and reducing the need for frequent reapplication. The proposed system minimizes off-target effects and protect beneficial organisms, such as pollinators and natural predators by offering precise and localized action of the pesticidal agents.

## (57) Abstract :

The present disclosure proposes an intelligent soil health assessment and regenerative management system (100) for improving long-term soil productivity and reducing dependency on chemical inputs. The proposed system (100) supports sustainable agricultural practices. The proposed system (100) monitors key soil health parameters such as organic matter content, microbial biomass, pH, salinity, and nutrient levels using a distributed network of embedded biosensors. The proposed system (100) enables the identification of early-stage soil degradation or nutrient imbalance. The proposed system (100) re-evaluates soil conditions after each intervention to optimize subsequent corrective actions and improve long-term soil management strategies. The proposed system (100) supports precision agriculture and maximizes crop productivity with minimal environmental impact. The proposed system (100) reduces dependency on chemical fertilizers and soil conditioners by promoting biologically-driven, sustainable methods of soil enrichment and regeneration.

(57) Abstract :  
The invention relates to Automatic Venturi Fire Extinguishing System (AVFES) for enclosed vehicle cabins. The system consists of an air intake, a high-pressure air compressor, a pressurized storage tank 1, an air distribution network, strategically positioned nozzles, fire detection sensors, and an electronic control unit. The control unit activates a solenoid valve, releasing compressed air through the nozzles 3 at high velocity, upon detection of fire or smoke. This creates a Venturi effect, generating suction that displaces oxygen from the cabin, effectively extinguishing the fire without the use of chemical suppressants. The system is fully automated, clean, and residue-free, making it safe for occupants and electronics. Modular nozzle 3 placement, sensor validation logic, and safety fail-safes ensure reliable operation. AVFES provides a rapid, non-intrusive fire suppression solution ideal for vehicles including buses, trucks, and passenger cars, especially in scenarios where occupants are unconscious, and unable to respond manually.

(57) Abstract :

The present invention represents an intelligent fault detection and emergency response system for oil and gas facilities, addressing critical safety and environmental challenges. It integrates ultrasonic, acoustic, catalytic, and infrared sensors to detect leaks, corrosion, and hazardous gases with high accuracy. A solar-powered GPS module ensures real-time fault localization, even in remote areas. The system autonomously triggers alarms and deploys emergency containment mechanisms such as sand bombs and zeolite/polymeric absorbents to mitigate spills and gas leaks. Machine learning algorithms enable predictive maintenance and fault trend analysis, enhancing long-term reliability. The system's eco-friendly, solar-powered design ensures uninterrupted operation while supporting sustainability goals. This invention offers a comprehensive, efficient, and autonomous solution to improve industrial safety, reduce environmental impact, and prevent operational disruptions in oil and gas handling and refinery operations by combining advanced sensing, automation, and AI.

(57) Abstract :  
The present invention relates to a system (100) and method (200) for generating user interface (UI) components using Artificial Intelligence (AI). The system leverages Natural Language Processing (NLP) to interpret user input in natural language to extract component requirements (202). A Contextual AI Engine (103) retrieves design guidelines and branding rules, and a Component Generation Engine (105) generates multiple UI component design options (204). A Live Preview Module (106) displays the generated options and enables real-time editing (205). The system also includes an Accessibility and Responsiveness Validator (107) to ensure compliance with accessibility standards and a Data Binding and Logic Automation Module (108) to automate data integration and interaction logic (207). The invention enables the creation of UI components from natural language input, automatically adapts components to match design systems, generates multiple design options, and automates data binding and logic generation. This approach reduces development time, ensures design consistency, enhances accessibility, and provides greater flexibility in UI design and customization. Fig. 1

(57) Abstract :

A plant health assessment system and method determine plant health using ultraviolet (UV) and visible light spectral images. The system includes a specimen imaging unit with a tray for leaf specimens, a UV light source, a UV pass filter, and an image-capturing device to capture images under UV and visible light with various flash modes. An integrated controller switches between UV and non-UV light sources. The data processing unit, connected to the imaging unit, comprises modules for image data processing, region of interest (ROI) detection using a Region Proposal Network (RPN) and Convolutional Neural Network (CNN), and plant health classification. The image data processing module standardizes images from the specimen imaging unit and external sources. The ROI detection module identifies features of interest, and the plant health classification module generates spectral representations, identifies differences, and classifies plant health status using a machine learning model.

(57) Abstract :

The present invention relates to a real time video surveillance system (100) for detection and tracking of cash theft based on CCTV vision and AI detection and method thereof. The system (100) comprises a memory (105) configured to store the information therein and a processor (106) configured to access video frames captured using one or more overhead video cameras, communication module (102) and alert module (120). The method for detecting and tracking cash theft by a person in an organization includes accessing video frames captured using cameras processing the videos to identify cash as present in the hands of a person in the space such that each detection corresponds to a cash present in the hands of a person as present in the space of the organization and analyzing the detections to define at least one of true positives and false positives associated with movement of cash in hand. (57) Abstract :

The present invention pertains to a nanoconjugate comprising a metal oxide nanostructure covalently and/or non-covalently conjugated to a  $\beta$ -lactam compound. In particular, the invention relates to novel  $\beta$ -lactam nanoconjugates with enhanced antimicrobial efficacy against drug-resistant microorganisms that produce  $\beta$ -lactamase. Additionally, the invention encompasses a method for synthesizing these nanoconjugates and their incorporation into pharmaceutical compositions.

(57) Abstract :

This invention relates to a self-healing wound dressing with antioxidant properties comprising a sodium alginate hydrogel matrix (1-3% w/v) crosslinked with calcium chloride (4-7% w/v). The hydrogel is embedded with zinc oxide nanoparticles (0.02-0.05% w/v) synthesized via hydrothermal treatment of zinc acetate dihydrate and citric acid monohydrate under basic conditions, and copper metal ion co-crystals (80-120 mg) prepared from benzimidazole and bromoacetic acid. The composition includes glycerol (5-8% v/v) for enhanced flexibility and ascorbic acid (8-12 mg) for antioxidant properties. The manufacturing process involves dissolving sodium alginate in water, incorporating glycerol, ZnO nanoparticles, copper co-crystals and ascorbic acid, followed by calcium chloride crosslinking. This novel wound dressing combines the healing properties of sodium alginate with the antimicrobial activity of zinc oxide nanoparticles and copper co-crystals, creating an effective treatment for wound management with self-healing capabilities. (57) Abstract :

A flexible helmet system is disclosed, comprising an impact-responsive liquid control mechanism that dynamically adjusts to external stimuli. The helmet includes an impact-resistant outer shell, a smart liquid chamber containing a shear-thickening fluid, embedded sensors, and a microcontroller executing real-time control algorithms. Upon detecting a high-velocity impact, the control unit triggers the fluid to harden locally, enhancing user protection. The helmet maintains flexibility under normal conditions and supports modular replacement of components. Additional features include wireless communication, environmental sensing, and predictive impact management. This intelligent, adaptive helmet offers advanced safety for users in high-risk environments.

(57) Abstract :

The present invention discloses a smart oil/ghee dispensing brush designed to provide controlled, hygienic, and efficient application of edible oils during cooking. The device consists of an ergonomic handle integrated with a refillable reservoir for storing oil or ghee, a button-operated dispensing mechanism for precise release, and high-quality silicone bristles for uniform application. The dispensing system includes an anti-leak nozzle that prevents accidental dripping, ensuring a clean and mess-free cooking experience. The parallel orientation of the bristles enhances user ergonomics and spreading efficiency. The detachable reservoir simplifies both refilling and cleaning, supporting hygienic reuse. This all-in-one solution eliminates the need for multiple utensils such as separate oil bowls, spoons, or brushes. The invention reduces oil wastage and promotes user convenience suitable for various cooking techniques including baking, grilling, roasting, and pan-frying.. The device presents a novel alternative to conventional oil application tools by combining precision control, portability, and ease of maintenance in a compact design.

(57) Abstract :

The present invention relates to a Vehicle to Driver Pedestrian Warning (VDPW) system designed to enhance road safety by preventing collisions between vehicles and pedestrians, particularly during overtaking manoeuvres. The system comprises a sensor fusion unit that integrates inputs from LiDAR, radar and cameras to detect pedestrian presence and movement in real-time. Upon detection, a portable projector mounted on the rear shelf of the vehicle projects a vivid red pedestrian symbol and directional cues onto the rear windshield. This visual alert warns following drivers of pedestrian activity ahead, enabling timely and informed driver responses. The system features adaptive calibration for various environmental conditions and vehicle types, ensuring consistent performance.

(57) Abstract :  
The present invention automates multilingual document localization through an AI-driven system (100) and method (200). The system includes an input unit (101) to receive a document, an AI-enhanced OCR module (102) for text extraction and error correction, and a translation module (103) to preserve semantic integrity. A document layout preservation engine (104) maintains structure, while a dynamic text resizing module (105) adjusts text positioning and font size. The output unit (110) generates a localized document matching the original format. Optional components include a user-assisted feedback module (107), a metadata preservation engine (108), and an AI-driven optimization module (109). The method involves pre-processing, text extraction, translation, formatting preservation, and adaptive layout adjustments, ensuring accuracy and efficiency in document localization.

(57) Abstract :

The present invention relates to a method for the extraction, isolation, and biological evaluation of bioactive phytoconstituents from the leaves of Lasia spinosa, a traditionally used medicinal plant, for potential therapeutic use in neuroinflammatory disorders. The invention describes a bio-assay guided approach utilizing methanolic extraction followed by chromatographic separation to identify fractions exhibiting antioxidant and neuroprotective activity. In-vitro studies on SH-SY5Y neuronal cell lines demonstrate that the extract significantly mitigates oxidative stress and reduces the expression of pro-inflammatory cytokines such as TNF- $\alpha$  and IL-6 induced by hydrogen peroxide (H<sub>2</sub>O<sub>2</sub>), without inducing cytotoxicity up to 40  $\mu$ g/mL. The method ensures efficient extraction using a hydroethanolic solvent system, followed by concentration and lyophilization to yield dry extract rich in active compounds. The invention provides a novel, plant-based approach to counteract neuroinflammation and supports the development of alternative therapies for neuroinflammation.

(57) Abstract :

The invention discloses a touchless hand gesture-based virtual keyboard (302). The method includes a step to receive video data from a video capturing device (104). Next, the method includes a step to analyze each frame of the video data using a hand tracking model and a user gesture profile to identify hand gestures and fingertip coordinates. Furthermore, the method maps the fingertip coordinates to specific regions on the virtual keyboard (302) based on the hand gesture and determines key selection based on the mapping in real-time. Additionally, the method displays the key selection based on the hand gesture on a display device (102). Fig. 3

(57) Abstract :  
The present invention discloses a computer-implemented system (100) and method (200) for managing visa application services through a unified digital platform. The system (100) comprises a user interface (106) for inputting visa-related data, an agent interface (104) for managing KYC-verified agent profiles, and a backend engine (108) integrating an artificial intelligence recommendation module (102), a secure document storage module (110), a notification and tracking module (112), a secure payment gateway (114), and a real-time communication module (116). The platform facilitates agent discovery, document submission, AI-based agent matching, milestone-based visa tracking, and secure financial transactions. The system (100) further includes automated alerts, a visa approval prediction module (118), mobile application access (120), and analytics dashboards (122) for agent performance. The invention enables a transparent, efficient, and secure visa application process for users and agents across web and mobile environments. Figure 1

(57) Abstract :

The present invention relates to a soil health monitoring and prediction system that integrates Internet of Things (IoT) sensors and computer vision technology to enable real-time, automated, and accurate assessment of soil conditions. The system comprises a large number of Smart Numeric Sensory Data Collection Devices (SNSDCDs), each equipped with sensors for measuring key soil parameters such as nitrogen, phosphorus, potassium (NPK), pH, moisture, temperature, humidity, and electrical conductivity. A smaller number of Edge Vision Devices (EVDs), equipped with high-definition cameras and edge processors, capture visual data of soil and crop conditions. Sensor and image data are transmitted to a cloud server where they are fused into a multimodal dataset. A machine learning model is trained on this dataset to identify patterns and correlations, enabling predictive analysis of soil health. The system operates autonomously using solar power and offers local storage and real-time clock functionality for reliable operation in remote areas. This integrated solution supports data-driven decision-making for sustainable agriculture by optimizing resource usage, improving crop yields, and enabling proactive land and soil management.

(57) Abstract :

The present invention introduces a portable pyrolysis system with integrated emission control and IoT-based carbon credit verification designed to convert biomass into biochar. The biochar can be used as an organic manure, providing a sustainable alternative to stubble burning. The disclosed pyrolysis system features a portable, stainless steel pyrolysis/kiln that utilizes flame-curtain pyrolysis (650±50°C) to achieve a 30% biochar yield efficiency. The closed-loop emission control unit (103) combines the features of a venturi scrubber chamber (103a) for particulate and gas removal along with an activated carbon filter chamber (103b) for adsorbing volatile organic compounds, resulting in a 75% reduction in harmful emissions. Integrated IoT sensors (105) monitor real-time operational data and are synchronized to a cloud-based dMRV platform, enabling automated carbon credit issuance and verification via registries like Carbon Standards International. (57) Abstract :

An automated utensil handling and cooking assistance system is comprising, a housing 101 with cavities 102 for gas burners on drawer-based enclosure 103s with vertical sliders 104, allowing upward movement for use and downward for storage, a microphone 106 receives voice commands, a central cavity 107 houses a spring-loaded pivot clamping arrangement 108 with a pivot arm 108a on a stepper motor to lift utensils, a spring 108b regulates lift height, and a limit switch verifies it, a temperature sensor detects utensil temperature, triggering a thermo-responsive C-shaped clamping assembly 108c with shape-memory alloy 108d to engage, a rotating bearing disc 109 with a thermocouple sensor repositions the utensil via the Seebeck effect, an L-shaped telescopic link 110 with a circular slider 112 and suction unit 113 controls the burner knob, a load sensor detects utensil weight, a multi-axis C-clamp arm 114 with silicone-covered mechanical gripper 115 ensure safe utensil transfer.

(57) Abstract :

The present invention relates to a real-time seizure detection system (100) comprising: (i) a wearable EEG headset (101) having at least one dry electrode selected from a hard dry electrode or a soft dry electrode, configured to capture multi-channel EEG signals from a patient; ii) a signal preprocessing unit (102) configured to perform amplification, filtering, normalization, segmentation, and augmentation of the EEG signals; iii) an embedded microcontroller unit (MCU) (103) with integrated AI acceleration configured to perform initial signal processing and manage data transmission; iv) a wireless module (104), preferably WiFi or Bluetooth, for transmitting preprocessed EEG data to a mobile or cloud-based processing unit (105); v) a deep learning inference engine (106) comprising a Convolutional Neural Network (CNN) model utilizing Global Average Pooling (GAP), trained to classify EEG signals into seizure or non-seizure events; vi) a post-processing module (107) configured to apply a moving average filter and peak detection to smooth classification output and identify seizure events; and vii) an alert generation module (108) configured to deliver real-time notifications to caregivers or clinicians upon detection of seizure events. ## (57) Abstract :

The present invention relates to a curcumin–glutaric anhydride–6-aminocaproic acid conjugate nanoparticles, comprising: i) 150mg of curcumin; ii) 35 mg of 4-dimethylaminopyridine (DMAP); iii) 7 ml of tetrahydrofuran (THF); iv) 1 ml of Et3N; v) 120 mg of glutaric anhydride (95%); vi) 200.0 mg of 6-aminocaproic acid; and vii) chitosan–poly(acrylic acid) (CS–PAA). The method for preparing conjugate nanoparticles, the method comprising: i) reacting curcumin with glutaric anhydride in the presence of 4-dimethylaminopyridine and triethylamine in tetrahydrofuran to form curcumin–glutaric anhydride intermediate; ii) activating said intermediate with N-hydroxy succinimide and dicyclohexyl carbodiimide to form an NHS ester; iii) coupling the NHS ester with ethyl 6-aminocaproate to form a curcumin–glutaric anhydride–6-aminocaproic acid conjugate; iv) dissolving chitosan in 1% acetic acid solution to prepare a 0.2% chitosan solution, and poly(acrylic acid) in distilled water to prepare a 0.2% PAA solution; v) adding said conjugate dissolved in a 1:1 ethanol-acetone mixture to the chitosan solution; vi) dropwise addition of the PAA solution into the drug-containing chitosan solution under magnetic stirring to form an opalescent suspension of nanoparticles; and vii) centrifuging and washing the nanoparticles, followed by freeze-drying to obtain drug-loaded CS–PAA nanoparticles. Fig 1 to 13.

(57) Abstract :

A system (100) for thermal management in computing devices, the system (100) comprising a computing device chassis (106) configured to function as a primary heat sink, at least one compact component heatsink (108) thermally coupled to a heat-generating component within the computing device chassis (106), a heat transfer mechanism configured to conduct heat from the at least one compact component heatsink (108) to the computing device chassis (106), a heat dissipation mechanism integrated with the computing device chassis (106) for removing heat from the computing device chassis (106) to an external environment, and a controller (104) configured to manage thermal operations of the system (100). (57) Abstract :

A system (100A, 100B) for detecting dielectric fluid leaks in a server environment, the system (100A, 100B) comprising a server motherboard (102), a plurality of sensors (114) arranged within the server motherboard (102), wherein each of the plurality of sensors is arranged in a predefined location to sense any environmental changes within the server chassis, a baseboard management controller (BMC) (112), and a processor (104) configured to receive sensor data from the plurality of sensors (114) via the BMC (112), analyze the sensor data to detect changes in at least one environmental parameter indicating a dielectric fluid leak, and generate an alert when the changes in the at least one environmental parameter exceed a predetermined threshold. FIG. 1B

## (57) Abstract :

Disclosed herein is a method for the preparation of herbal hair dye (100) comprises collecting and cleaning plant materials (102). The method also includes drying the cleaned plant materials (104), pulverizing the dried plant materials into a fine powder and storing the powdered material (106). The method also includes subjecting the powdered plant material to cold maceration by soaking it in a solvent in a closed container (108) and filtering and pressing the macerated mixture (110). The method also includes concentrating the filtered extract by evaporating the solvent (112). The method also includes mixing predetermined quantities of the dried extracts of plant materials in a sufficient quantity of ethanol (114). The method also includes applying the herbal dye formulation to human white hair by immersing the hair in the formulation (116). The method also includes removing the formulation from the hair and assessing the color retention (118).

(57) Abstract :

The present invention relates to a hybrid active-passive cooling system designed for railway tunnels, aimed at overcoming challenges associated with overheating, energy inefficiency and infrastructure deterioration. The system combines passive thermal regulation components such as geothermal heat pipes utilizing nanofluids, phase-change material (PCM) panels for thermal energy storage and conductive Aluminum rail cooling plates, with active components including AI-controlled variable-speed fans, ultrasonic misting units for emergency cooling and regenerative braking-based energy recovery systems. The invention significantly reduces reliance on external power sources by integrating self-sustaining energy harvesting technologies, such as piston-effect turbines and piezoelectric track harvesters. A predictive control framework employing LSTM neural networks forecasts heat loads in advance, enabling precise thermal management. The modular and retrofittable architecture allows scalable deployment across various tunnel types with minimal downtime. The system operates on a zero-water, closed-loop basis and incorporates fire-resistant PCMs and explosion-proof enclosures for enhanced safety.

(57) Abstract :  
The invention discloses a compact and ultra-wideband annular ring microstrip antenna (ARMSA) designed for Ku-band (12–18 GHz) and K-band (18–27 GHz) applications, including satellite communication and radar systems. The antenna consists of a dual concentric ring configuration on FR4 substrate (er = 4.4, thickness = 1.6 mm) with full copper ground plane. Multiple circular and rectangular slots are embedded into the radiating rings to enhance impedance bandwidth and gain. The antenna is excited using a coaxial probe feed optimized through electromagnetic simulation. The proposed design achieves measured bandwidth of 5.28 GHz, spanning from 14.67 GHz to 19.95 GHz, and a peak gain of 7.86 dB. The structure provides low fabrication cost, compact size, and high efficiency, makes it suitable for integration into space-constrained and portable systems. The antenna design is simulated and validated using HFSS software and is optimized for wideband, high-gain, and stable performance in high-frequency applications.

(57) Abstract :

The present invention relates to a high-performance, environmentally friendly silica aerogel insulation for industrial heat exchangers that is made from rice husk waste using a silica extraction method aided by bioenzymes. To create an extremely lightweight, highly porous structure with superior thermal insulation, the aerogel is reinforced with biopolymer nanofibers and dried using supercritical CO2. In order to prevent moisture absorption and corrosion under insulation (CUI), surface treatments employing graphene oxide and silane impart superhydrophobicity and corrosion resistance. Durability is increased by embedded self-healing microcapsules, which allow for the automatic repair of microcracks caused by heat or moisture. By stabilizing temperature fluctuations and increasing heat exchanger efficiency, the incorporation of nano-encapsulated phase change materials (PCMs) offers thermal energy buffering. The sustainable, cost-effective solution significantly reduces heat loss, enhances equipment longevity, and minimizes environmental impact in industrial thermal management applications.

(57) Abstract :

A system for controlled fruit ripening, comprises of a DAC unit 101 with a fan 102 and a latticed sorbent matrix 103 for selectively capturing carbon dioxide gas, a heat exchanger 104 for regenerating the sorbent, a filter unit 105 for removing moisture and particulates from the carbon dioxide, a compressor 106 to compress carbon dioxide, a storage tank 107 to buffer and store compressed carbon dioxide, PEM electrolyzer unit 108 for electrolyzing water, a feed gas conditioning and mixing unit 110 to combine carbon dioxide and hydrogen gases, a methanol separation and purification unit 112 to condense, separate, and purify methanol, a MECM 114 for converting methanol to ethylene gas, an ethylene gas storage module 116 for dosing of ethylene gas, a fruit sorting cabinet 117 for classifying fruits, multiple sealed fruit ripening chambers 115 to facilitate optimal ripening conditions.

(57) Abstract :

A fruit storage and preparation system, comprising a refrigerator body 101, imaging unit 103 detecting, ripeness, spoilage, on the fruits, clamping unit 105 holds fruit packets, motorized roller 106 compacting waste packets, motorized cutting blade 107 cuts open packets, a cleaning chamber 110 including a motorized clamp 111 for securing fruits and a dual-section water tank 112 for supplying and draining water, a U-shaped plate 115 hold and secure individual fruits during transportation, a fruit preparation unit 118 arranged via a tilted frame 119 that slides fruits downward, and comprises of a peeling unit 120 and a motorized fruit cutter 121 to cut fruits, a flap 123 is attached to a two-axis sliding unit 124 to gently deposit the prepared fruit into temporary storage member 122, a wearable wristband 125 via a second sensing module detect vital health parameters of the user.

(57) Abstract :

The advanced pyrolysis-based conversion system introduces an innovative AI-driven analytical framework for pine cone biomass-to-bio-oil transformation that integrates computational optimization protocols with adaptive process control mechanisms, facilitating real-time parameter adjustment, dynamic yield optimization, and robust quality assurance while maintaining seamless production integration and operational efficiency for consistent bio-oil production from lignocellulosic feedstock. [510] The comprehensive conversion framework employs adaptive machine learning algorithms and intuitive process optimization protocols, utilizing embedded computational processing arrays and energy-efficient pyrolysis systems to ensure optimal temperature control, enhanced conversion efficiency, and maximum bio-oil yield while maintaining continuous production monitoring capabilities and feedstock quality assessment. [515] The integrated methodology combines multi-parameter pyrolysis optimization with artificial intelligence-driven process control systems, leveraging variable-temperature analytical signals and multi-factor yield indicators to optimize conversion procedures and production workflows for maximum bio-oil quality and minimal energy consumption during critical biomass transformation applications. [520] The novel responsive pyrolysis architecture features engineered high-precision temperature control components with specialized biomass preprocessing protocols, enabling complex multi-stage conversion verification while ensuring production consistency and performance optimization across various feedstock compositions without compromising system reliability or product quality. [525] The innovative design incorporates strategic validation mechanisms for enhanced pine cone biomass conversion and product security, utilizing optimized multi-stage pyrolysis systems and adaptive control technology to ensure legitimate bio-oil production while maintaining functionality across diverse biomass environments and processing scenarios. [530] Implementation methodology emphasizes scalable production integration and efficient conversion sequences, implementing interactive process monitoring measures and pattern recognition algorithms to achieve superior bio-oil yield, enhanced product quality, and unauthorized production prevention while ensuring technological simplicity during biomass processing operations. [535] The system demonstrates exceptional adaptability through comprehensive integration of conversion optimization protocols and intelligent pyrolysis technologies, validating its effectiveness across various pine cone biomass configurations and processing scenarios while maintaining consistent production performance and operational efficiency under diverse feedstock conditions. [540] The developed framework enables sustainable and reliable conversion of pine cone biomass through streamlined, AI-powered pyrolysis systems, providing significant advantages over traditional conversion approaches through variable optimization mechanisms, adaptive control protocols, and improved yield prediction while maintaining superior production accuracy during critical bio-oil generation procedures.

(57) Abstract :

The present invention relates to a composition of tea waste-derived hydrochar for removal of nitrate ions from aqueous solutions, wherein the hydrochar comprises: (i) a carbonaceous porous matrix derived from thermochemically treated tea waste; (ii) surface functional groups selected from hydroxyl (-OH), carboxyl (-COOH), and quinone groups; and (iii) moisture content of less than 10% by weight. The method for synthesizing tea waste-derived hydrochar for adsorption of nitrate ions from aqueous solutions, the method comprising: (i) washing a tea waste (TW) sample with distilled water to remove contaminants including milk, sugar, and coloring agents; (ii) boiling said TW sample for removal of residual coloring agents; (iii) drying said TW sample at a temperature of approximately 80°C for about 10 hours; (iv) grinding and sieving said TW sample through a 100-mesh sieve to obtain a processed sample; (v) subjecting 6 g of said processed sample to hydrothermal carbonization in a Teflon-lined container with 200 ml deionized water at a temperature of 180°C for a duration of approximately 10 hours in an autoclave; (vi) filtering and repeatedly rinsing the resulting hydrochar product with deionized water until a neutral pH is achieved; (vii) air-drying the hydrochar at ambient temperature for approximately 24 hours; and (viii) weighing the final dried hydrochar to determine yield. (57) Abstract :

The present invention discloses a system and method for an AI-based solar-powered agricultural robot designed to autonomously perform diverse farming operations such as irrigation, pesticide spraying, weeding, and soil monitoring. The system comprises a mobile robotic platform equipped with solar panels for energy harvesting, battery storage for energy management, and modular task-specific attachments. An onboard AI processing unit analyzes real-time environmental data from integrated sensors and autonomously determines appropriate actions to optimize crop health and resource usage. The robot utilizes GPS and obstacle avoidance technologies for autonomous navigation and supports remote monitoring via IoT connectivity. This invention provides a sustainable, intelligent, and flexible solution for modern precision agriculture, particularly in off-grid and labor-constrained environments. (57) Abstract :

The present invention provides a deep neural network-based framework for advanced sentiment analysis and emotional tone detection from textual and multimodal data sources. Existing sentiment analysis methods, including rule-based and lexicon-driven systems, often fail to interpret context-sensitive expressions, sarcasm, and implicit emotions, leading to inaccurate predictions. The proposed invention utilizes advanced deep learning architectures such as Recurrent Neural Networks (RNNs), Long Short-Term Memory (LSTM) networks, CNN, and transformer-based models including BERT and GPT, to capture rich contextual semantics and improve classification accuracy. The framework incorporates attention mechanisms to dynamically highlight sentiment-relevant features. Transfer learning techniques are applied to fine-tune pretrained language models for domain-specific tasks and low-resource languages. Data augmentation methods such as back-translation and synonym substitution are employed to enhance training data variability and generalizability. A distinctive feature of this invention is its multimodal integration, combining textual, visual, audio, and video data for holistic sentiment and emotion recognition. The system includes Explainable AI (XAI) modules—such as attention visualization, sentiment heatmaps, and feature attribution—to ensure interpretability and transparency in predictions. Designed for scalability and real-time performance, the invention can be deployed across cloud infrastructures, mobile applications, and streaming analytics platforms. It is particularly suitable for use in industries such as marketing, healthcare, finance, customer experience management, and public governance, where real-time emotional intelligence and sentiment analysis are essential for data-driven decision-making and user engagement enhancement.

(57) Abstract :  
ABSTRACT The AI-based Smart Modular Air Purification Pole System introduces an innovative solar-powered environmental framework for urban areas that integrates biometric pollution detection protocols with adaptive filtration mechanisms, facilitating real-time contaminant capture, dynamic operational adjustment, and robust air quality improvement while maintaining seamless urban integration and infrastructural integrity for consistent public health protection. [510] The comprehensive purification framework employs adaptive algorithmic systems and intuitive environmental assessment protocols, utilizing embedded neural processing arrays and energy-efficient filtration systems to ensure timely pollution identification, enhanced atmospheric cleansing, and optimal operational integrity while maintaining continuous air quality monitoring capabilities. [515] The integrated methodology combines sustainable energy utilization with artificial intelligence-driven purification systems, leveraging pattern-variable pollution signals and multi-factor environmental indicators to optimize treatment procedures and operational workflows for maximum public health protection and minimal energy consumption during critical pollution events. [520] The novel responsive modular architecture features engineered weather-resistant components with specialized pollution anomaly detection protocols, enabling complex multi-stage air purification while ensuring operational consistency and performance optimization across various environmental conditions without compromising system reliability. [525] The innovative design incorporates strategic filtration mechanisms for enhanced urban air protection and operational efficiency, utilizing optimized response systems and adaptive purification technology to ensure effective contaminant removal while maintaining functionality across diverse metropolitan environments and pollution scenarios. [530] Implementation methodology emphasizes scalable infrastructure integration and efficient operational sequences, implementing interactive purification measures and pollution response algorithms to achieve superior air quality control, enhanced public health protection, and urban contamination prevention while ensuring technological simplicity during environmental emergencies. [535] The system demonstrates exceptional adaptability through comprehensive integration of pollution detection protocols and intelligent purification technologies, validating its effectiveness across various urban configurations and environmental scenarios while maintaining consistent operational performance and energy efficiency under diverse conditions. [540] The developed framework enables sustainable and reliable protection of urban air quality through streamlined, AI-powered purification systems, providing significant advantages over traditional environmental approaches through variable response mechanisms, adaptive operational protocols, and improved pollution management while maintaining superior public health outcomes during critical pollution interventions.

(57) Abstract :  
ABSTRACT The AI-based air purification system introduces an innovative artificial intelligence-driven environmental remediation framework for high-smog urban areas that integrates real-time pollution detection protocols with adaptive filtration mechanisms, facilitating continuous air quality monitoring, dynamic purification adjustment, and robust particulate matter removal while maintaining sustainable energy consumption and operational efficiency for consistent environmental protection. [510] The comprehensive purification framework employs adaptive sensor algorithms and intelligent control protocols, utilizing embedded neural processing arrays and solar-powered energy systems to ensure timely pollution identification, enhanced filtration performance, and optimal air quality improvement while maintaining continuous environmental monitoring capabilities. [515] The integrated methodology combines renewable energy generation with artificial intelligence-driven purification systems, leveraging pattern-variable sensor signals and multi-stage filtration indicators to optimize purification procedures and energy workflows for maximum environmental benefit and minimal power consumption during critical pollution episodes. [520] The novel responsive purification architecture features engineered weather-resistant components with specialized air quality anomaly detection protocols, enabling complex multi-stage filtration verification while ensuring purification consistency and performance optimization across various environmental conditions without compromising system reliability. [525] The innovative design incorporates strategic sensor mechanisms for enhanced pollution detection and operational efficiency, utilizing optimized challenge-response systems and adaptive purification technology to ensure legitimate environmental benefit while maintaining functionality across diverse urban environments and traffic scenarios. [530] Implementation methodology emphasizes scalable infrastructure integration and efficient purification sequences, implementing interactive monitoring measures and pollution response algorithms to achieve superior air quality control, enhanced environmental protection, and unauthorized emission mitigation while ensuring technological simplicity during peak pollution periods. [535] The system demonstrates exceptional adaptability through comprehensive integration of pollution detection protocols and intelligent purification technologies, validating its effectiveness across various urban configurations and traffic scenarios while maintaining consistent environmental performance and operational efficiency under diverse atmospheric conditions. [540] The developed framework enables sustainable and reliable purification of urban air environments through streamlined, AI-powered filtration systems, providing significant advantages over traditional air cleaning approaches through variable sensor mechanisms, adaptive purification protocols, and improved environmental management while maintaining superior air quality improvement during critical smog episodes.

(57) Abstract :

A self-purifying holy water dispenser comprising a food-grade water storage tank with a level sensor, a multi-stage filtration system (sediment filter, activated carbon filter, and UV sterilization chamber), a blessing chamber, a hands-free dispensing mechanism, a user interface, an energy-efficient design, and IoT capabilities. The level sensor monitors the water level, alerting users when refilling is necessary. The filtration system removes contaminants, while the UV chamber inactivates microorganisms. The blessing chamber sanctifies the purified water according to religious traditions. The dispensing mechanism ensures hygienic and controlled dispensing, and the user interface allows selection of the desired amount and displays the dispenser status. The energy-efficient design reduces consumption and prolongs component life. IoT capabilities enable remote monitoring of performance, filter status, and water quality. The embodiments are interconnected via pipes and valves, ensuring seamless operation and instant access to clean, sanctified holy water.

(57) Abstract :

The present invention relates to a wrist-worn wearable device for personal safety, comprising an integrated system of biometric sensors, GPS tracking, audio-visual modules, and an artificial intelligence (AI)-based analytics engine. The device continuously monitors physiological parameters to detect abnormal or distress conditions. Upon identifying such anomalies via pre-set voice commands, the device autonomously triggers emergency alerts. These alerts include real-time transmission of the user's location, live audio and video feeds to pre-registered emergency contacts and authorities. The device further incorporates an AI-driven threat prediction module that analyzes environmental data and user behaviour to anticipate and prevent potential risks. It also includes a self-defense shock mechanism and a navigation system that guides the user to the nearest safe location or police station. The invention provides a comprehensive and proactive personal safety solution, enhancing emergency response efficiency and user protection in critical situations.

(57) Abstract :  
The present invention presents a new annular ring microstrip antenna (ARMSA) designed for high-performance Ku band applications. The design features rectangular slot elements and a centrally slotted circular patch, placed strategically to enhance impedance characteristics, radiation efficiency, and bandwidth. The antenna, when implemented on an FR4 substrate, provides a compact and low-cost solution, which makes it suitable for advanced satellite and radar communication systems. By electromagnetic simulation via Ansys HFSS, the antenna has a measured bandwidth of 3.9 GHz and a maximum gain of 8.55 dB, as well as a return loss of -16.79 dB, reflecting very good impedance matching and low reflection loss. The suggested geometry improves surface current control and directional radiation and is superior to conventional circular slot-based annular ring structures. The antenna offers a useful and scalable approach for future wireless systems demanding strong, high-speed data transmission across the Ku band frequency range.

(57) Abstract :

The present invention relates to a compact, energy-efficient maize de-husker cum sheller machine designed for small and marginal farmers. The machine comprises a rectangular feeding hopper for introducing whole maize cobs, a threshing unit with a rasp bar cylinder fitted with circular bars for simultaneous dehusking and shelling, and a spring-mounted adjustable concave for handling varying cob sizes. The rasp cylinder is driven by a 2 HP single-phase electric motor through a belt and pulley system. An integrated axial blower fan, powered by the same motor, facilitates separation of husk and dust from clean maize grains. The device includes an inclined grain outlet aligned with the angle of repose of maize, and a separate residue outlet for husks and cob cores. The machine achieves shelling efficiency above 98%, cleaning efficiency around 97%, and minimal grain breakage (<1%), offering a throughput of approximately 400 kg/h. The portable design with wheels allows easy transport for on-site threshing. This invention reduces post-harvest labor and improves processing speed, quality, and affordability for small-scale agricultural operations.

(57) Abstract :

Silver has been utilized since ancient ago because of its brilliant, shiny appearance, silver has been used as a precious material for adorning jewelry and ornaments for a very long time. Beyond its ornamental and monetary value, silver possesses a myriad of practical applications across various industries, owing to its unique properties and versatility. One notable aspect of silver is its tendency to tarnish. This tarnish can diminish the metal brightness and aesthetic appeal. The issue of silver objects rusting, even under museum ambient conditions, has been well documented. The present investigation report focuses on the fabrication of hydrophobically modified nano zirconia particles using the sol-gel method to prevent tarnishing of silver metal. Synthesized nano zirconia sol was characterized by infrared spectroscopy. Zirconia particle size was determined to be 55 nm and zeta potential of -36.25 mv which indicating the overa

(57) Abstract :

Water is a fundamental necessity for our existence but its rapid contamination is causing devastating effects on environment and health of living species worldwide. Sequestration of the persistent pollutants from the water is essential for achieving the sustainable development goal (SDG 6) adopted by UN for 2030. Adsorptive removal of pollutants is one of the popular water treatment techniques because of its simplicity, affordability, and the broad range of available adsorbents. Among the diverse range of adsorbents utilized for water applications, graphene-based materials are gaining substantial attention in the water treatment applications owing to their unique physicochemical properties. Clay minerals are also quite popular adsorbents due to their low cost, abundant availability and environment compatibility. In this respect, GO intercalate

(57) Abstract :

This invention explores the conversion of waste bael (Aegle marmelos) shells into Microfibrillated Cellulose (MFC) for sustainable food packaging. Present invention characterized both raw and extracted bael shell material using FTIR, revealing increased crystallinity (from 18.89% to 39.59%) after MFC extraction. Our investigations into MFC-based films, particularly composites with guar gum and chitosan, showed strong interactions (covalent and hydrogen bonding) confirmed by FTIR. While X-ray diffraction indicated an amorphous structure in the final films, FE-SEM analysis revealed a dense, disordered network that improved their water contact angle as MFC concentration increased. Furthermore, we observed strong binding affinity between cellulose I $\beta$  and chitosan (-7.3 kcal/mol), suggesting enhanced compatibility. Notably, incorporating MFC significantly boosted the films' antioxidant capacity, increasing it from 10.90% to 61.80% with higher MFC concentrations demonstrating superior scavenging activity. This research highlights the potential of bael shell waste as a valuable resource for developing functional and environmentally friendly food packaging materials.

(57) Abstract :

A method (300) for automated irrigation management is disclosed. The method (300) includes receiving (302), a plurality of environmental parameters. Further, comparing (304), a current value of the moisture with a predefined threshold value indicative of moisture present in a soil of each of a plurality of portions. Further, identifying (306), at least one portion from among the plurality of portions, in response to determining that the current value of the moisture of the at least one portion is less than the predefined threshold value. Further, determining (308), simultaneously, whether a weather-related parameter indicates no rainfall for a predefined period in the surrounding of the agricultural area. Further, initiating (310), irrigation of the identified at least one portion in response to the determining weather-related parameter indicates no rainfall for the predefined period.

(57) Abstract :

The invention provides a hybrid solution combining both hardware and software components. It operates as a smartphone-based system designed to monitor, analyze, and validate ink color accuracy during commercial and industrial printing operations. By leveraging the ubiquity of smartphones and integrating them with advanced image processing algorithms, the system offers a cost-effective and portable alternative to conventional spectrophotometers.

(57) Abstract :

Disclosed herein is a transformable weather protection garment and method thereof (100) that comprises a body portion (102) configured to cover a torso region of a user and for supporting transformation features for dual-purpose usage in both garment and bag configurations, a plurality of accessible storage pockets (104) connected to the body portion (102), a plurality of sleeve portions (106) attached to opposite sides of the body portion (102) configured to encase the arms of a user during wear, a concealed zipper (108) integrated inside each of the plurality of sleeve portions (106) configured to enable each sleeve portion (106) to retract into the body portion (102), a transformation enclosure (110) positioned along a rear surface of the body portion (102), a pair of flap-covered compartments (112) integrated over the transformation enclosure (110), a pair of adjustable strap elements (114) operably connected to the transformation enclosure (110).

(57) Abstract :

IoT and Machine Learning-Enabled System and Method for Smart Waste Monitoring and Optimization in Smart Cities is the proposed invention. The proposed invention focuses on understanding the functions of Optimization in Smart Cities. The invention focuses on analyzing the parameters of Smart Waste Monitoring using algorithms of IoT Approach.

## (57) Abstract :

The Medical Health e-card is a comprehensive digital healthcare solution designed to enhance emergency medical response and streamline patient care. At its core, the system integrates a real-time ambulance service equipped with GPS location tracking, enabling swift dispatch and arrival during critical situations. Crucially, this is coupled with immediate access to a patient's pre-existing medical history, providing emergency room staff with important information for informed decision-making from the moment of contact. Beyond emergencies, the e-card facilitates the identification of the most appropriate hospital for a patient's specific needs, considering factors such as available services, specialized departments relevant to their condition, and even insurance coverage where applicable. A significant feature of the Medical Health e-card is its secure repository for storing and managing patient prescriptions and comprehensive medical reports. This digital record benefits both healthcare providers by offering a holistic view of the patient's health journey and family members by providing a centralized and accessible source of crucial medical information. To further enhance usability and security, the system incorporates patient details management, a secure QR code-based login mechanism for quick and reliable access, the ability to view and manage digital doctor prescriptions, and a detailed directory of specialized doctors practicing within the user's vicinity. By integrating these diverse services, the Medical Health e-card aims to significantly improve medical safety, optimize the selection of healthcare services, and provide a robust platform for managing individual health information effectively.

(57) Abstract :

The present invention relates to an the Skill Tracker and Micro-Certification Portal is a secure, web-based platform designed to assist educational institutions in monitoring student skill development and awarding performance-based certifications. It enables students to select specific skill domains and complete multi-format assessments, including MCQs, written tasks, voice inputs, and video submissions. The system integrates TSAT scores and communication skill evaluations into a weighted performance matrix. Administrators can manage modules, track individual and group performance, and issue certificates when predefined criteria are met. Students receive downloadable certificates and digital badges, which are showcased on a personalized public profile. The platform bridges the gap between academic learning and industry requirements by providing transparent, credible, and cost-effective internal certification.

(57) Abstract :  
The present invention pertains to a scramjet inlet apparatus featuring a rectangular, converging-diverging duct with a constant-width cross-section. The system includes an angled inlet ramp for compressing hypersonic airflow, a central constant-area combustor section for maintaining uniform flow and combustion, and a diverging nozzle for flow expansion and thrust generation. Integrated onto the internal surfaces of the inlet ramp are passive flow control elements (riblets and micro-ramps) that function to reduce skin friction drag and suppress shock-induced boundary layer separation. This configuration enables enhanced pressure recovery, improved flow stability, and superior performance across a wide range of Mach numbers. Compared to existing designs, the apparatus offers improved manufacturability and aerodynamic efficiency. Its rectangular cross-section and structured integration of riblets and micro-ramps make it particularly suitable for high-speed propulsion applications in advanced aerospace systems.

(57) Abstract :

The present invention provides a nutritionally-enriched multigrain Litti premix formulated using a curated blend of cereal and legume-based flours along with dehydrated vegetable powder to offer a health-oriented adaptation of a traditional Indian food. The premix comprises Ragi flour, Maize flour, Besan (chickpea flour), Wheat flour, Sattu (roasted gram flour), and dried Carrot powder in specific proportions to deliver a balanced profile of proteins, fiber, complex carbohydrates, vitamins, and minerals. The premix is shelf-stable due to controlled dehydration and blending techniques and is capable of conveniently reconstitution with water and oil to prepare dough for Litti. The invention also discloses a method for preparing the premix and for making stuffed Litti, ensuring ease of preparation, nutritional enhancement, and scalability for commercial packaging and distribution.

(57) Abstract :  
The present invention relates to an AI-powered, integrated wellness management system, designed to provide personalized, emotionally intelligent health support through a mobile platform. The system consolidates multiple wellness domains including nutrition tracking, emotional health monitoring, micro habit formation, social motivation, and reflective journaling into a unified digital ecosystem. Core modules include an interactive wellness timeline that visualizes progress through milestones; a Snap & Learn nutrition analyzer that uses computer vision to evaluate food intake; an engine that delivers daily behavioral prompts; a Health Buddy Connect module for AI-based peer matching; and a Talk to Future You feature that stores motivational time capsule messages. The platform is supported by a secure, encrypted backend and an adaptive AI engine for real-time personalization. Optional wearable integration allows biometric syncing. The present invention addresses fragmentation in existing wellness tools by delivering a holistic, adaptive, and emotionally engaging solution for sustainable personal health improvement and user empowerment.

(57) Abstract :

The present invention provides a natural, biodegradable under-eye hydrogel patch formulated using chia seed mucilage, algal exopolysaccharides (EPS), cordycepin, and mycosporine-like amino acids (MAAs), along with plant-based additives such as aloe vera and rosewater. The hydrogel matrix formed by chia seed mucilage and algal EPS ensures sustained hydration, film formation, and controlled delivery of embedded bioactives. Cordycepin, derived from Cordyceps militaris, exhibits anti-aging, antioxidant, and anti-inflammatory properties, while MAAs extracted from marine algae offer natural UV protection and antioxidant defense. The formulation is further enhanced with gum arabic for structural stability and skin adhesion. Designed for topical application, the patch provides targeted treatment for under-eye concerns including dryness, pigmentation, puffiness, and fine lines. The invention offers a sustainable and effective alternative to synthetic cosmetic patches, being suitable for sensitive skin and contributing to environmentally responsible skincare solutions.

(57) Abstract :  
The invention discloses an AI-based adaptive spiritual assistant system designed to personalize Bhakti Yoga and meditation practices through real-time biometric analysis and immersive experiences. An AI-based adaptive spiritual assistant system, comprising: at least one biometric sensor (101) selected from EEG headband (102), heart rate monitor (103), and voice analysis module (104) for collecting real-time physiological and emotional data from a user; a signal processing unit (105) configured to filter and process the biometric data; an emotion recognition engine (106) operable to determine the user's mental and emotional state; and an AI engine (107) configured to generate personalized Bhakti Yoga and meditation recommendations based on the processed biometric and emotional data. AI engine (107) comprises a Natural Language Processing (NLP) module (108). AI-based adaptive spiritual assistant further comprises a reinforcement learning module (109) and a virtual reality (VR) and/or augmented reality (AR) module (110).

(57) Abstract :

The invention relates to a nanobot-integrated bioelectronic tattoo for real-time health monitoring and autonomous drug delivery. The tattoo comprises a flexible, biocompatible polymer layer embedded with nanosensors for molecular-level biomarker detection. Wireless data transmission, AI-based health analytics, and predictive modeling enable proactive healthcare management. The device includes a self-powered drug delivery system that releases medication upon detection of abnormal biomarker levels. Powered by thermoelectric, piezoelectric, and RF energy harvesters, the tattoo offers a non-invasive, self-sustaining, and intelligent alternative to existing wearable health technologies.

(57) Abstract :

The advanced AI-powered electrical vehicle manufacturing system introduces an innovative multi-stage production framework for Super Electrical Vehicle (SEV) assembly that integrates computational optimization protocols with adaptive manufacturing determination mechanisms, facilitating real-time component identification, dynamic production optimization, and robust quality assurance confirmation while maintaining seamless assembly integration and operational accuracy for consistent vehicle manufacturing. [510] The comprehensive manufacturing framework employs adaptive machine learning algorithms and intuitive production protocols, utilizing embedded computational processing arrays and energy-efficient assembly systems to ensure timely component identification, enhanced vehicle understanding, and optimal manufacturing reliability while maintaining continuous production monitoring capabilities. [515] The integrated methodology combines multi-dimensional manufacturing techniques with artificial intelligence-driven pattern recognition systems, leveraging variable-frequency production signals and multi-factor quality indicators to optimize assembly procedures and manufacturing workflows for maximum production accuracy and minimal defect uncertainty during critical vehicle applications. [520] The novel responsive manufacturing architecture features engineered high-precision assembly components with specialized vehicle fingerprinting protocols, enabling complex multi-stage component verification while ensuring manufacturing consistency and performance optimization across various production instruments without compromising system reliability. [525] The innovative design incorporates strategic validation mechanisms for enhanced SEV identification and structural security, utilizing optimized multi-technique systems and adaptive manufacturing technology to ensure legitimate vehicle assembly while maintaining functionality across diverse production environments and manufacturing scenarios. [530] Implementation methodology emphasizes scalable manufacturing integration and efficient assembly sequences, implementing interactive production measures and pattern recognition algorithms to achieve superior structural determination, enhanced component identification, and unauthorized assembly prevention while ensuring technological simplicity during production monitoring. [535] The system demonstrates exceptional adaptability through comprehensive integration of vehicle identification protocols and intelligent manufacturing technologies, validating its effectiveness across various SEV production configurations and assembly scenarios while maintaining consistent manufacturing performance and operational efficiency under diverse conditions. [540] The developed framework enables sustainable and reliable manufacturing of Super Electrical Vehicles through streamlined, AI-powered production systems, providing significant advantages over traditional manufacturing approaches through variable validation mechanisms, adaptive identification protocols, and improved assembly assignment while maintaining superior manufacturing accuracy during critical vehicle production procedures.

(57) Abstract :  
The present invention relates to a real-time, hardware-integrated device for the fast translation and summarization of health-related text-based information. The device combines an optical sensor, OCR technology, and natural language processing (NLP) to extract and summarize medical content from printed or digital documents. The system includes multilingual support and a text-to-speech (TTS) engine for generating clear, audible summaries. A form recognition module detects structured fields in medical documents, while a data insertion module auto-fills these fields with relevant extracted information. The device features a touch-enabled display for user interaction and a verification module for reviewing and confirming output accuracy. Bluetooth connectivity ensures seamless integration with hospital systems and electronic health record (EHR) platforms. Additional capabilities include sentiment analysis, adaptive voice modulation, and real-time error handling. Designed to enhance clinical workflows and reduce manual effort, the invention provides an intelligent, efficient, and accessible solution for medical data communication and decision support.

(57) Abstract :  
The present invention introduces an advanced concave cambered propellant tank design intended to enhance rocket performance by improving fluid dynamics and structural efficiency. The tank features a uniquely concave internal geometry that guides liquid fuel smoothly along its curved surfaces, significantly reducing sloshing and minimizing in-flight vibrations. Central to the design is an integrated cylindrical chamber for oxidizer storage, eliminating the need for separate tanks and optimizing spatial efficiency. Radial support structures maintain the integrity of the concave shape while contributing to overall weight reduction. This configuration streamlines the propellant delivery system, decreases geometric residuals, and maximizes usable volume, thereby improving stability, efficiency, and mission performance.

(57) Abstract :

The present invention relates to a solar-powered, spring-assisted stair-climbing shoe designed to aid individuals, particularly the elderly and those with joint-related conditions, in ascending stairs with reduced physical strain. The shoe integrates thin-film solar cells on its surface to harness solar energy, which is stored in a rechargeable battery. A barometric elevation sensor embedded in the midsole detects stair height, transmitting data to an Arduino microcontroller. The Arduino calculates and activates the appropriate thrust force via pistons and springs embedded within the sole based on the detected elevation. The spring compresses during foot contact, while the piston delivers an upward force to assist in stair climbing. The system provides adaptive support, improves mobility, and promotes independence for users with limited lower limb strength. The components are ergonomically integrated within the sole and upper regions without compromising the shoe's flexibility or comfort.

(57) Abstract :

The invention discloses a Bluetooth-based proximity-activated door locking system that allows secure, keyless, and contactless access control using a mobile device. The system includes a microcontroller, a Bluetooth module, a locking mechanism, and a power source. An authorized mobile device, paired via a dedicated application, enables the door to unlock when it comes within a predefined Bluetooth range and re-locks automatically when the device exits the range. The system operates without internet connectivity, ensuring offline security and minimizing remote hacking risks. The mobile application manages access control, user authorization, and system status. The invention eliminates the need for physical keys or cards and overcomes the vulnerabilities of Wi-Fi-based and NFC-based door systems. It is suitable for various door types in homes, offices, and secure facilities. Enhanced features include multi-user access, optional biometric verification, access logs, and tamper resistance. The system offers a cost-effective and reliable alternative for modern security needs.

(57) Abstract :  
The present invention relates to an integrated bioreactor system designed to enhance biohydrogen production through anaerobic fermentation of organic waste. The system uniquely combines a fluidized bed zone and a packed bed zone within a single reactor chamber or modular configuration. The fluidized bed zone, located at the lower section, ensures efficient substrate mixing and mass transfer using suspended carrier particles, while the packed bed zone, positioned above, facilitates stable biofilm formation and microbial retention. This dual-zone design overcomes common limitations such as biomass washout, clogging, and low hydrogen yield found in traditional reactors. The reactor includes a gas-liquid separator, heating jacket, effluent outlet, and embedded sensors linked to an automated control unit for real-time monitoring of key operational parameters. The invention supports a wide range of feedstocks and scalable configurations, offering a reliable, flexible, and energy-efficient platform for sustainable biohydrogen production and effective organic waste utilization.

(57) Abstract :

The present invention relates to a smart self-cleaning water bottle that utilizes a dual sterilization mechanism combining Ultraviolet-C (UV-C) light and electrostatic pulse technology to effectively disinfect drinking water and the bottle's internal surfaces. An intelligent self-cleaning water bottle, comprising: a body (101) with an interior chamber for holding water; a UV-C LED module (102); a quartz lens (103); one or more electrostatic plates (104); one or more sensors (105) within the bottle configured to detect turbidity and moisture content; a microcontroller (106) configured to receive input from said sensors and activate the UV-C light and/or electrostatic plates; a rechargeable battery (107); and a Bluetooth module (108) configured to transmit data to a mobile application for monitoring water quality, battery status, and cleaning cycles. The present invention further comprises a USB-C charging interface (109) located at the base of the bottle for fast and universal recharging of the battery.

(57) Abstract :  
The present invention relates to a smart rudraksha mala integrating traditional spiritual practices with modern technology. The mala consists of rudraksha beads embedded with miniature sensors (Structure of the Smart Rudraksha Mala), connected via a flexible thread housing wiring to a central microprocessor (Sensor and Microprocessor Integration). This microprocessor, located in the tassel, processes data from the sensors to analyze chanting speed, consistency, and rhythm. A haptic feedback mechanism (Haptic Feedback Mechanism) in the tassel provides tactile alerts for real-time user guidance. The system interfaces with a mobile application (Mobile Application Interface) via Bluetooth, offering personalized mantra recommendations, progress tracking, and custom alerts. This innovation enhances mantra chanting by providing immediate feedback and personalized guidance, seamlessly blending traditional spiritual tools with advanced technological features.

(57) Abstract :  
The present invention relates to an AI-based educational query response system (100). The system (100) comprises a multi-query generation module that reformulates a user's natural language query into multiple semantically diverse versions using a large language model. A semantic retriever employing a vector database and a keyword-based retriever using BM25 independently retrieves relevant documents. The results from both retrievers are combined and ranked using a weighted aggregation method to identify the most relevant content. The top-ranked documents, along with the original query, are then processed by a large language model to generate a coherent and precise response. The system (100) enables efficient access to academic information, reduces manual search time, and enhances the user experience through intelligent, domain-specific query processing. The invention is particularly suited for deployment in educational institutions and is scalable for other information-dense domains

(57) Abstract :

The invention discloses a natural herbal tea composition using Butea monosperma, lemongrass, ajwain, and tulsi. Each herb is individually dried, crushed, and combined to provide antioxidant, immune-boosting, and digestive benefits. The tea is provided in tea bags or loose form, free of additives, suitable for daily consumption. A method of preparing a herbal tea composition comprises the steps of: separately drying Butea monosperma petals, lemongrass leaves, ajwain leaves, and tulsi leaves at a temperature in the range of 60°C to 70°C for individual durations ranging from 5 to 10 hours, mixing the dried ingredients in select proportions, coarsely crushing the mixed ingredients, and packaging the crushed composition into tea bags or containers.

(57) Abstract :

The present disclosure pertains to a device (100) utilizing a federated learning framework for dynamically providing personalized content to a user. The method (200) includes receiving (202) one or more image frames of a user, voice inputs from the user and geo location information of the device associated with the user via one or more sensors associated with the device and simultaneously fetching (204) the historical sleeping pattern of the user from the memory. The method (200) include predicting (206) an emotional state of the user based on the one or more image frames, the voice inputs and the historical sleeping patterns and simultaneously predicting (208) the current environmental condition around the user based on the geolocation information. The method (200) dynamically providing (210) the content to the user in real time based on the emotional state, the current environmental condition, and the historical sleeping patterns.

(57) Abstract :

The present invention provides a machine learning-based predictive maintenance system for industrial equipment health monitoring. The system utilizes real-time sensor data and historical operational patterns to assess equipment condition, predict potential failures, and estimate remaining useful life (RUL). It integrates data preprocessing, feature extraction, supervised and unsupervised learning models, and an intelligent recommendation engine to enable proactive maintenance actions. By reducing unplanned downtime and optimizing maintenance schedules, the invention enhances equipment reliability, operational efficiency, and cost-effectiveness across diverse industrial environments.

(57) Abstract :

The present invention relates to a wearable ophthalmic device in the form of smart glasses designed to analyze and display the refractive power of the user's eyes in real time. Integrated with infrared-based sensors or micro-cameras (104) within a standard spectacle frame and controlled via a microcontroller (103), the device enables users to initiate an eye scan through a button (101) or touch-sensitive interface. The measured optical power (in Dioptres) is instantly shown on an OLED or digital screen (102) embedded in the glasses' arm. This eliminates the need for bulky auto refractors or trial lenses, offering a portable, self-operable solution for vision assessment. Ideal for personal eye monitoring or preliminary clinical diagnosis, the device ensures fast, convenient, and accurate refractive power evaluation.

(57) Abstract :

The present invention discloses an Adaptive Smart Windshield System designed to enhance driver safety and visibility by providing automated glare reduction through dynamic transparency control. The system features a multi-layered windshield comprising a Suspended Particle Device (SPD) film on the upper 30% for instant dimming of high-beam glare, a Pi-Polarizer layer on the middle 40% to filter horizontally polarized reflections, and an Anti-Reflective (AR) coating (SiO<sub>2</sub> + MgF<sub>2</sub>) across the entire surface to minimize light scattering. The lower 30% remains uncoated to preserve visibility and reduce cost. An Intelligent Controller Unit (ICU) with ambient light sensors, and a microcontroller continuously monitors incoming light intensity and activates the SPD and Pi-Polarizer layers in real time. The system responds within milliseconds, reduces glare intensity by up to 85%, and automatically reverts to a transparent state when glare subsides. It operates efficiently on 3–7W and integrates seamlessly with existing vehicles, ensuring compliance with safety standards.

(57) Abstract :  
The present invention discloses a system for adaptive vehicle speed adjustment based on real-time pedestrian movement analysis to enhance road safety, particularly in urban environments. The system comprises a network of sensors, including radar, LiDAR, infrared, camera, and depth sensors, configured to detect pedestrian movement around a vehicle. A processing unit analyzes pedestrian walking speeds, directions, and trajectories using predictive algorithms, including machine learning techniques. Based on this analysis, a control unit dynamically adjusts vehicle speed to maintain a safe distance from pedestrians and prevent collisions. The system also includes a graphical user interface that provides real-time visual and auditory alerts to the driver, and an external light alert system that activates warning signals when the vehicle speed exceeds a safe threshold relative to pedestrian movement. Additional components include data storage for logging interactions, adjustable mirrors for improved sensor range, and communication modules for transmitting data to nearby vehicles, supporting proactive collision prevention.

(57) Abstract :

An automatic prasad maker is disclosed, comprising ingredient storage compartments, a mixing chamber, a cooking unit, a dispensing mechanism, and a user interface. The machine features wireless connectivity for remote monitoring and control, a self-cleaning system, a modular design, and advanced sensors. The machine produces consistent, hygienic prasad offerings while reducing manual labor. The invention streamlines the prasad preparation process in temples and religious institutions, setting a new standard for automated food preparation in the realm of religious offerings.

(57) Abstract :

The present disclosure relates to a gripping force verification (GFV) system (102). The GFV system includes a force sensing unit (204). The force sensing unit (204) includes a plurality of load sensors (206, 208, 210, 212). The plurality of load sensors (206, 208, 210, 212) are interconnected horizontally or vertically with a plurality of tension strings (214, 216) configured to be gripped and compressed by a gripper (304). The gripper (304) is actuated to impart a gripping action on the plurality of tension strings (214, 216) to generate a tension force along each tension string. Further, the force sensing unit (204) is configured to generate sensor data corresponding to the tension force. Furthermore, the GFV system (102) includes a controller (310) communicably coupled to the force sensing unit (204), configured to calculate a resultant force based on the sensor data. [To be published with FIG. 1]

(57) Abstract :

The present disclosure discloses a handwoven textile fabric comprising a warp yarn and a weft yarn interlaced in a weave structure selected from the group consisting of plain weave, twill weave, herringbone twill, zigzag twill, diamond twill, and straight twill; wherein the warp yarn is selected from the group comprising a golden zari thread wrapped around a resham thread, a China silk yarn, and a 100% Pashmina yarn; wherein the weft yarn is selected from the group consisting of a 100% Pashmina yarn, a 100% Pashmina yarn twisted together with a golden zari thread, a blend comprising 85% wool and 15% silk, a blend comprising 75% wool, 15% silk, and 10% Cashmere Pashmina, a modal yarn, and a colored Pashmina yarn. (57) Abstract :

Silver has been cherished since ancient times for its radiant, brilliant, and shiny appearance. This lustrous metal has been widely utilized as a precious material for crafting jewelry, ornaments, and decorative items throughout history Its unique combination of beauty, malleability, and resistance to tarnish made it highly sought after by various civilizations. One notable characteristic of silver is its tendency to tarnish over time. This process is common in environments where hydrogen sulfide is prevalent, such as areas near industrial emissions, natural gas sources, or even in everyday surroundings containing sulfur. The deterioration of the silver surface results in the degradation of both its aesthetic and conductive characteristics. The present investigation report focuses on the fabrication of hydrophobically modified silica particles using the sol-gel method to prevent tarnishing of silve

## (57) Abstract :

The invention provides an integrated converter system (100) and method for electric vehicles that combines motor propulsion and multi-mode battery charging using a switched reluctance motor (110) with N isolated phase windings. The integrated converter (130) operates as an N-phase asymmetric half-bridge during propulsion and is reconfigurable via relays (J1, J2) for various charging modes without additional hardware. The system supports single-phase AC charging using a bridgeless boost PFC stage and a bidirectional DC-DC converter (150), three-phase AC fast charging through a boost rectifier stage, and DC or vehicle-to-vehicle (V2V)/vehicle-to-grid (V2G) charging using buck/boost operation. Selected motor windings act as inductors during charging. Rotor positions are chosen to neutralize torque generation, maintaining rotor standstill. Control strategies include closed-loop CC/CV profiles, dual synchronous reference frame (DSRF) control for unbalanced grids, and maximum power point tracking (MPPT) for DC sources. The system reduces cost, size, and complexity in EV powertrains. Figure 1

(57) Abstract :

The present invention relates to using a hydrothermal process, highly vertically aligned ZnO nanorods are grown over Si substrates. Two steps are used to generate ZnO nanorods. First, using the sol-gel process, an ideal ZnO seed layer with a nucleation site with a particle size of around 40 nm is formed on an n-type Si wafer. On such spots, nanorods with lengths ranging from 250 to 400 nm are subsequently produced. These nanorods underwent FESEM analysis, and XRD is used to establish their phase. In a stainless-steel autoclave walled with Teflon, the pressure effect is investigated at 5 bar.

(57) Abstract :

Wheat straw (WS) is a potential biomass having no economic value but has vast environmental consequences. Valorization of WS to its biochar (WS-BC) with further NaOH activation (WS-NBC) was fabricated and employed as an adsorbent to eliminate tetracycline (TTC) from contaminated solution. The process fabrication was an initial pyrolysis under N<sub>2</sub> atmosphere at 450°C to form WS-BC followed by its impregnation with NaOH to form WS-NBC. Characterization studies revealed the successful fabrication of activated biochar having favourable surface functionalities and well-defined porosity as per FTIR and BET studies. Batch adsorption tests conducted under operating conditions of 10 ppm of TTC, adsorbent dosage of 1g/L, for a contact duration of 30 minutes and at neutral pH revealed 89% removal efficiency. Adsorption tests revealed not only fast kinetics but a

(57) Abstract :

With the assumption that composites exhibit better adsorptivity, and better stability, magnetite@chitosan composite (MNP@CT) was fabricated to evaluate its adsorptive behavior towards two different classes of pollutants: tetracycline (TTC) and Eriochrome Black-T (EBT) from wastewater. A study of its adsorptivity under identical conditions revealed higher EBT removal rates but TTC lower removal when compared to its pristine counterparts (EBT: 86%; TTC: 62%) as compared to that for MNP (EBT: 40%; TTC: 73%) and that for CT (EBT: 93%; TTC: 42%). Detailed characterization studies revealed that MNP@CT showed a dispersed nano-rod type particle with low crystallinity as compared to the highly crystalline, aggregated spherical MNP. While the surface functionality was enhanced, the particle surface area, mesoporosity, total pore volume and magnetization showed a decrease in the

(57) Abstract :  
The present invention to an adaptive multi-frequency dielectric sensing system for real-time and high-precision monitoring of soil and crop conditions in rice cultivation. The system features multi-depth dielectric probe arrays (DMPA) and employs frequency-modulated wave transmission combined with reflectometry to measure key dielectric properties, including dielectric constant, phase shift, attenuation, and resonance across various soil layers and crop zones. The system dynamically adjusts to environmental variations, allowing continuous, multi-depth, and multi-frequency data acquisition. A Reflectometry and Transmission Analyzer (RTA) processes signal responses, while a cloud-integrated AI module analyzes the data using machine learning algorithms to predict parameters such as soil moisture content, conductivity, nutrient distribution, and root structure density. The system is designed for seamless integration with IoT-enabled precision agriculture frameworks, supporting automated irrigation control, remote sensing calibration, and efficient resource management. This invention offers a significant improvement in data-driven agricultural practices, contributing to enhanced productivity, sustainability, and decision-making in crop management.

(57) Abstract :  
The present invention relates to an automated, AI-driven system for real-time water quality monitoring, utilizing a network of IoT-based sensors to continuously measure key parameters including pH, temperature, dissolved oxygen, turbidity and various chemical and biological contaminants. Sensor data is transmitted in real-time to a cloud-based analytics platform, where advanced machine learning algorithms detect anomalies, predict contamination events and forecast water quality trends. The system features a user-friendly dashboard for data visualization, configurable alerts and automated regulatory compliance reporting. Integration with water treatment infrastructure enables dynamic process control, while edge computing ensures low-latency operation in remote environments. Energy-efficient, solar-powered sensors support sustainable deployment and blockchain integration ensures data integrity. Scalable and adaptable, the system is applicable across municipal, industrial, agricultural and environmental sectors, offering a cost-effective solution for proactive and reliable water quality management.

(57) Abstract :  
The present invention discloses an AI-based system for the real-time diagnosis and rehabilitation of oculomotor dysfunctions, particularly abnormalities in saccadic and pursuit eye movements. The device integrates high-precision eye-tracking sensors within a virtual reality (VR) headset to capture fine-grained eye movement data. An embedded artificial intelligence engine analyzes the data using machine learning algorithms trained on normative and pathological profiles to detect irregularities such as delayed saccades, unstable pursuits, and fixation drifts. Based on the diagnosis, the system delivers personalized, adaptive therapy exercises supported by real-time multimodal biofeedback, including visual, auditory, and haptic cues. A connected interface allows clinicians to remotely monitor user progress and adjust therapy protocols. The system generates detailed graphical outputs such as heatmaps and trajectory plots for visual analysis and longitudinal tracking. The invention is suitable for clinical, home, educational, and sports vision applications, transforming conventional neuro-visual therapy through intelligent automation.

(57) Abstract :

The present invention presents a Virtual Reality (VR)-based historical reconstruction system that leverages reverse engineering and artificial intelligence (AI) to recreate ancient environments with high accuracy and interactivity. The system integrates high-resolution optical sensors, depth measurement units, metal, and radiation detectors to capture detailed spatial and material data from historical sites. Advanced data processing algorithms and AI-driven models, including machine learning and generative adversarial networks (GANs), are employed to reconstruct 3D virtual environments. A model refinement module allows for continuous enhancement based on expert feedback and historical references. The reconstructed models are visualized through immersive AR/VR platforms, offering users interactive features such as navigation, overlays, and contextual information. The system also supports data management, user feedback analysis, and cloud-based processing for large-scale reconstructions. Designed for education, research, and virtual tourism, this scalable and portable solution enhances cultural heritage preservation by delivering dynamic, engaging, realistic experiences of historical events and environments.

(57) Abstract :  
The present invention relates to a Virtual Mentorization AI-Based System for Auto Reverse Engineering Education, a portable, AI-driven educational platform designed to deliver personalized learning experiences. The system digitizes educational materials, analyzes content, and generates individualized learning paths using advanced Optical Character Recognition (OCR), Natural Language Processing (NLP), and Augmented Reality (AR). The system adapts content difficulty, pacing, and format in real-time by interpreting user performance and interaction data. It incorporates a feedback loop powered by reinforcement learning to optimize instructional delivery continuously. The AR module offers immersive simulations and visual guidance, enhancing conceptual understanding. A built-in assessment engine provides quizzes and interactive tasks, while a data repository stores user history to inform future learning adaptations. The system’s reverse engineering approach deconstructs complex material into manageable learning units, fostering deeper comprehension and retention. This system represents a transformative solution in personalized, intelligent education tailored to diverse learning needs and environments.

(57) Abstract :  
The present invention relates to an AI-powered system and method for automating the preparation and filing of insolvency applications. It leverages artificial intelligence technologies, including natural language processing (NLP) and machine learning (ML), to extract, analyze, and process financial and legal data from sources such as accounting software, bank statements, credit reports, and court databases. The system comprises key modules: a data ingestion engine, a decision engine trained on statutory criteria and historical cases, a document generator that auto-fills jurisdiction-specific templates, and a compliance checker to validate legal conformity. An intuitive user interface facilitates applicant interaction, while AI-driven risk assessment enhances decision accuracy. Integration with government and court portals enables real-time electronic filing.

(57) Abstract :

The present invention discloses a smart healthcare monitoring and data integrity system that integrates Internet of Things (IoT) and blockchain technologies to provide secure, real-time, and reliable health data management. The system employs a network of IoT-enabled biosensors to continuously monitor physiological parameters such as heart rate, temperature, blood pressure, and glucose levels. These sensors transmit data to edge computing nodes, which perform preprocessing, anomaly detection, and encryption. The processed data is then securely transmitted to a permissioned blockchain network, where it is immutably recorded using lightweight consensus algorithms. Smart contracts are deployed to govern access control, automate alerts, and ensure compliance with regulatory standards. Patients maintain ownership of their health data and can manage permissions through blockchain-based digital identities. The invention addresses key challenges in healthcare such as data tampering, unauthorized access, and system interoperability, providing a scalable, decentralized framework suitable for hospitals, remote care, and chronic disease management. ## (57) Abstract :

Diabetes mellitus is a chronic metabolic disorder characterized by hyperglycemia, necessitating effective and natural therapeutic approaches. This study aimed to formulate and evaluate an antidiabetic herbal syrup using Banana Stem Water (*Musa paradisiaca*), Jamun Seed Powder (*Syzygium cumini*), Giloy Powder (*Tinospora cordifolia*), Aloe Vera Juice (*Aloe barbadensis*), and Barley Flour (*Hordeum vulgare*), known for their hypoglycemic properties. Banana stem water acts as a diuretic and helps regulate blood sugar, while Jamun seed powder contains jamboline, which slows glucose release. Giloy enhances insulin sensitivity, Aloe Vera juice improves glycemic control by reducing fasting blood glucose, and Barley flour, rich in beta-glucans, delays carbohydrate absorption. The syrup was prepared by maceration, decoction, and mixing with excipients like honey and preservatives for stability. Physicochemical evaluation included pH, viscosity, density, and sweetness consistency. In-vitro antidiabetic activity was assessed using alpha-amylase and alpha-glucosidase inhibition assays, demonstrating significant enzyme inhibition comparable to standard acarbose. Stability studies over 60 days under different conditions confirmed the syrup's shelf life. Preliminary phytochemical screening revealed the presence of flavonoids, alkaloids, tannins, and saponins, contributing to its antidiabetic effects. The syrup exhibited a pleasant taste, optimal viscosity, and good palatability in sensory evaluation. In-vivo studies on diabetic-induced rats showed a notable reduction in blood glucose levels. The formulated syrup presents a promising natural adjunct for diabetes management, combining traditional knowledge with scientific validation, offering a safe, cost-effective, and easily administrable alternative to synthetic drugs.

(57) Abstract :

The present invention relates to a manually operable toothbrush integrated with a built-in toothpaste dispensing mechanism. The toothbrush comprises a hollow handle containing a refillable toothpaste chamber 101, 201, a horizontally aligned piston 203, and a spring-actuated mechanism 204 controlled by a manually operated button 102, 209. One or more glass ball valves 205 are provided to function as non-return valves, ensuring unidirectional flow and preventing backflow or leakage. The device is compact, non-electric, and enables clean, consistent, and hygienic dispensing of toothpaste directly onto the bristles. The integrated structure minimizes waste, improves convenience, and eliminates the need for separate toothpaste tubes.

(57) Abstract :

The present invention relates to an Automated Secure Parcel Delivery System (ASPS) that provides a comprehensive, smart and secure infrastructure for last-mile parcel delivery. The system integrates multiple advanced technologies, including biometric and OTP-based authentication, AI-driven route optimization, real-time GPS and RFID tracking and autonomous delivery vehicles such as drones or self-driving vans. Smart delivery lockers equipped with surveillance cameras, tamper-evident packaging and weight sensors ensure secure, contactless delivery and retrieval by authorized recipients only. A centralized AI engine monitors parcel integrity and environmental conditions during transit, enabling anomaly detection and proactive threat response. A user-friendly mobile application provides real-time updates, secure locker access and delivery confirmations, while seamless integration with e-commerce platforms and predictive maintenance capabilities enhance operational efficiency. The ASPS offers a scalable and future-ready logistics solution optimized for smart cities, high-volume delivery environments and sensitive or time-critical goods.

(57) Abstract :  
The present invention discloses a next-generation Unmanned Aerial Vehicle (UAV) system that combines Vertical Take-off and Landing (VTOL) capabilities with high-speed fixed-wing flight for enhanced operational flexibility. Designed for military and defense applications, the UAV integrates a solid-fuel rocket-assisted escape system that enables rapid altitude gain or evasive maneuvers upon threat detection, significantly improving mission survivability. The stealth-optimized airframe, constructed from low Radar Cross Section (RCS) composite materials and featuring a swept-back wing design, minimizes radar detectability. A modular payload bay supports a variety of mission profiles including Intelligence, Surveillance, and Reconnaissance (ISR), Electronic Warfare (EW), tactical strike, and logistics. The hybrid propulsion system, aerodynamic efficiency, and compact, rugged design allow deployment in confined or hostile environments without the need for runways. This invention represents a strategic advancement in UAV technology for modern, high-risk battlefield operations.

(57) Abstract :

Disclosed herein is a pet safety monitoring device and method thereof (100) that comprises a harness body (102) configured to be worn by a pet and shaped to accommodate various body sizes of different animals, a plurality of sensors (104) operatively connected to the harness body (102), the plurality of sensors (104) configured to detect physiological and environmental parameters associated with the pet and transmit corresponding sensor data, a central processing unit (106) operatively connected to the plurality of sensors (104), the central processing unit (106) configured to process data signals and execute control commands, the central processing unit (106) comprising; a location tracking module (108), a motion detection module (110), a sound detection module (112), a communication network (114) operatively connected to the central processing unit (106), a user device (116) operatively connected to the communication network (114), a user interface (118) integrated inside the user device (116).

(57) Abstract :

The present invention provides a food-safe method and system for producing mango seed kernel flour with significantly reduced tannin content. The process includes cleaning mango seeds, drying to facilitate shell removal, slicing kernels, soaking in a dilute sodium meta-bisulfite solution with periodic solution replacement, blanching at 80–90°C, drying to moisture below 10%, milling, and sieving to obtain uniform flour. This method reduces tannin content by up to 87%, improving taste, protein digestibility, and suitability for food applications. The system comprises integrated modules for cleaning, drying, shell removal, slicing, soaking with agitation, blanching, drying, milling, sieving, and packaging, enabling scalable industrial production. The invention adds value to mango processing by-products and promotes sustainable food ingredient development without using harmful chemicals.

(57) Abstract :

The present invention discloses a portable, multi-functional device (100) that integrates water purification with on-demand electrical energy generation for charging portable electronic devices. The device (100) comprises a housing containing a water inlet, a micro-turbine generator, a multi-stage water purification unit, a power management module with a rechargeable battery, and at least one electrical output port. As water flows through the device (100), the kinetic energy is harnessed by the turbine to generate electricity, which is either stored or used to directly charge devices such as smartphones. The water simultaneously passes through filtration and sterilization stages to ensure safe drinking water. The system operates without reliance on grid electricity, making it particularly suitable for off-grid environments, emergency relief scenarios, and outdoor activities

(57) Abstract :

The invention provides a process of preparing ceramic powder samples by the solid-state reaction process. After that, it is mixed with polyvinylidene fluoride (PVDF) to form composite membrane, which is fabricated using the solution cast method. Two membranes were prepared with 15 wt% and 50 wt% filler concentrations of BCZT with PVDF matrix. Dielectric behaviours of prepared composite membrane are analyzed, and these various analyses of composite film are also compared with each other. In this, we see that the increasing addition of lead-free based inorganic filler with an organic PVDF matrix enhanced the dielectric constant five times for the frequency 1KHz and reduction in the losses and increases the conductivity of the composite as the filler weight percentage increased. These fabricated composite membrane can be used for wearable biomedical devices, soft robotics and flexible energy storage c

(57) Abstract :

The present invention relates to a Universal Learning and Summarization Device is a portable, real-time system designed to extract, analyze, and summarize text using advanced referential algorithms. Equipped with a high-resolution camera and Optical Character Recognition (OCR) technology enhanced by Convolutional Neural Networks (CNNs), the device accurately captures and converts text from physical or digital sources into a machine-readable format. It employs Natural Language Processing (NLP) techniques and semantic analysis to compare newly captured text against stored content, highlighting differences and generating concise summaries using both extractive and abstractive methods. An integrated Augmented Reality (AR) interface overlays these summaries onto the original document for enhanced user interaction. The system continuously improves through user feedback and a learning module, ensuring adaptive summarization and better knowledge retention. Additional features include a customizable user interface, memory storage, real-time processing, and efficient power management, making it an ideal tool for students, educators, and professionals.

(57) Abstract :  
The present invention presents a Virtual Mentor Matching Platform that leverages Natural Language Processing (NLP) and voice analysis to optimize tutor-student interactions. The system dynamically matches students with mentors based on academic performance, learning preferences, and real-time communication cues. It integrates a microphone and audio analysis module to extract vocal features such as pitch, tone, and tempo during tutoring sessions. These features are evaluated by an engagement assessment module to generate an engagement score, enabling adaptive feedback and instructional adjustments. The NLP module analyzes written and spoken responses to identify learning gaps and generate personalized educational content. A feedback generation system uses machine learning to provide actionable insights for both students and mentors. The platform also includes modules for mentor matching, progress-tracking, and real-time visualization, ensuring a holistic and responsive learning environment. The system enhances educational outcomes by providing intelligent, personalized, and data-driven mentorship designed to be scalable and energy-efficient.

(57) Abstract :  
The present invention discloses an intelligent latching control system for a vehicle seat, comprising an electromechanical actuator, a control unit with a multi-modal logic controller, and sensors including a weight sensor and inertial measurement unit (IMU). The system operates in automated, manual override, and crash-responsive modes based on inputs received via wireless signal or manual input. A safety check module evaluates predefined parameters before allowing latch actuation, ensuring secure release only under safe conditions. A crash detection module overrides normal logic to trigger latch locking or unlocking based on impact or abnormal motion. The system includes a feedback module for notifying users and a logging module for recording events. A sleep mode conserves power post-operation. The system supports wireless authentication, OTA updates, and optional energy harvesting, offering enhanced safety, reliability, and user control in vehicular environments.

(57) Abstract :

The present disclosure provides a physiological monitoring system (100) comprising a tension-adaptive strap (102) configured to encircle a thoracic region and constructed from dual-elastic fabric enabling dynamic expansion. The system (100) includes a plurality of biopotential electrodes (104) positioned on an inner surface of the strap (102) and a plurality of piezoelectric sensing strips (106) embedded between said electrodes (104). A clasp enclosure (108) centrally affixed to the strap (102) houses a signal processing unit interfacing the electrodes (104) and sensing strips (106), and a wireless transmission interface (110) configured for IoT-based data communication. The system (100) employs an IoT architecture for continuous acquisition and transmission of physiological signals. The signal processing unit includes embedded AI analytics for real-time classification of cardiopulmonary conditions using learned signal patterns. The AI analytics framework enables adaptive filtering and anomaly detection, enhancing diagnostic accuracy during ambulatory use. Fig. 1

(57) Abstract :

The invention relates to a real-time behavioural nudging system designed to assist investors in making rational financial decisions. It integrates AI-driven sentiment analysis, pattern recognition, and reinforcement learning to detect cognitive biases and provide timely, personalized nudges. The system monitors market conditions, investor behaviour, and sentiment data to deliver context-aware interventions that counteract biases such as loss aversion, FOMO, and panic selling. By offering just-in-time financial guidance, this invention aims to enhance investor discipline, minimize irrational decision-making, and improve financial outcomes.

(57) Abstract :

The present invention relates to an autonomous pollination robot configured to mimic the behavior of bees for agricultural crop enhancement. The system comprises a lightweight aerial drone equipped with biomimetic flapping wings or multi-rotors, a pollen collection mechanism using electrostatic or adhesive surfaces, and a pollen deposition mechanism for targeted pollination. The drone integrates AI-based navigation, environmental sensors, and machine vision for real-time identification of flowers, bloom assessment, and obstacle avoidance. Powered by rechargeable batteries and optionally solar panels, the system autonomously navigates agricultural fields to collect and deposit pollen, thereby improving pollination efficiency and crop yields. The invention addresses the decline in natural pollinators and offers a sustainable, scalable, and intelligent solution for precision agriculture.

(57) Abstract :  
The present invention discloses a wearable sensor system designed to enhance workplace productivity and employee well-being through real-time monitoring and intelligent task optimization. The system integrates an optical sensor and an MPU6050 motion sensor to capture visual and physical data, such as task progress, ingredient handling, hand gestures, and body orientation. A processor analyzes the sensor inputs and delivers real-time feedback and time-based recommendations through an augmented reality (AR) interface, aiding multitasking and ergonomic posture. A data analytics module powered by machine learning algorithms identifies inefficiencies, tracks performance trends, and generates actionable insights. The system includes a communication interface for data transmission to central servers and a user feedback module to refine system behavior. Designed for adaptability across various work environments, the system supports personalized calibration, seamless integration with workplace management systems, and visual performance dashboards.

(57) Abstract :

The present disclosure relates to a system and method to authenticate user identity using quantum computing-based techniques that provide secure, tamper-evident, and non-reproducible authentication. The system comprises a quantum key generation module, a self-evolving entanglement matrix, a quantum encoder for embedding identity data into quantum states, a quantum channel interface, and a quantum interference detection module to identify spoofing or tampering attempts. A quantum-classical identity hashing engine fuses quantum measurement outcomes with classical data to generate a unique, session-specific identity signature. A processor orchestrates the authentication lifecycle and initiates access control or secure erasure based on signature validation and interference checks. Additionally, a blockchain anchoring module immutably records authentication events for post-quantum auditability. The method includes generating quantum keys, encoding user input into quantum states, detecting tampering, and authorizing access based on hybrid identity verification. This invention offers a resilient and adaptive approach to identity authentication, suitable for post-quantum security infrastructure. Fig. 3.

(57) Abstract :

The Present invention discloses an AI-driven cybersecurity system that combines honeypot-based data collection with machine learning algorithms for real-time threat detection. Honeypots are deployed to attract malicious activity, capturing detailed logs and network data. This data undergoes preprocessing and feature extraction before being used to train multiple machine learning models, including Random Forest, SVM, Decision Tree, and Naive Bayes. The best-performing model is selected based on accuracy, precision, and recall metrics and deployed for live intrusion detection. The system supports continuous learning to adapt to new threats and includes interpretability features for transparent decision-making. This integrated approach offers automated, scalable, and highly accurate protection against evolving cyberattacks.

(57) Abstract :

The present invention relates to an energy-efficient smart home automation system utilizing context-aware artificial intelligence (AI). By integrating IoT sensors and machine learning algorithms, the system collects real-time data on occupancy, environment, and appliance usage to optimize energy consumption. The AI analyzes user behavior and environmental conditions to autonomously control lighting, temperature, and devices, thereby reducing energy waste and enhancing user comfort. A user interface allows feedback, monitoring, and manual overrides, while the system continuously learns to improve efficiency. It also supports renewable energy integration and secure data transmission. This invention promotes sustainable living, cost savings, and intelligent automation within modern households.

(57) Abstract :

The present invention discloses a compact handheld cleaning apparatus employing capillary action for efficient dust removal in hard-to-reach or low-clearance areas. Inspired by the ink-filling mechanism of fountain pens, the device features a micro-channeled suction tip that draws in dust through finely engineered grooves using passive capillary dynamics, with or without powered airflow. It operates in manual or motorized modes, utilizing either a bellows/piston mechanism or a low-powered fan to initiate airflow. The capillary-assisted nozzle design ensures effective dust collection at low energy consumption, particularly in narrow spaces beneath furniture or in tight corners. The apparatus includes a modular cleaning head, integrated microfiltration, and a removable dust chamber for hygienic maintenance. Soft bristles around the tip enhance surface contact and agitation, while interchangeable nozzles support different cleaning scenarios. Ergonomically shaped like a pen for precision handling, the invention provides a silent, energy-efficient alternative to conventional vacuums and brooms in confined environments.

(57) Abstract :

The present invention relates to a self-cooling, water-recycling hydration bottle that combines passive evaporative cooling with an integrated water recovery system in a compact, portable form. Utilizing a superabsorbent polymer (SAP) hydrogel core, the device regulates controlled water release to enable continuous cooling without external energy input. A multi-stage spiral condensation system efficiently captures and recycles over 80% of evaporated moisture, converting it into potable water. Key features include an optimized SAP matrix for evaporation control, a passive fin-based condenser for vapour recovery, and a closed-loop design that conserves water while maintaining user comfort. The bottle requires no electricity, offers reliable thermal regulation, and supports prolonged use in diverse environments. Ideal for outdoor activities, emergency kits, and everyday hydration, this innovation merges sustainable engineering with practical design, delivering dual functionality, cooling, and hydration in a durable, user-friendly, energy-independent system.

(57) Abstract :

The present invention relates to a wearable gesture-based monitoring system for real-time detection of incorrect posture and prediction of fall events. A wearable gesture-based monitoring system for detecting incorrect posture and predicting fall events in a user, comprising: a. an inertial measurement unit (IMU) including an accelerometer, gyroscope, and magnetometer for detecting motion and orientation; an optical sensor comprising a Time-of-Flight (ToF) module for monitoring foot elevation and stride length; a microprocessor configured to process real-time data from the IMU and ToF sensor and execute a machine learning algorithm to detect postural deviations and predict fall likelihood; a feedback module including a vibration motor for providing haptic alerts upon detection of posture anomalies or fall risk; and a communication module for transmitting data to external devices for logging or remote monitoring.

(57) Abstract :

The present invention relates to a voice-activated smart home system (100) that enables users to control household appliances using either voice commands or a web-based interface, without requiring continuous internet connectivity. The system (100) comprises a local AI assistant for interpreting voice inputs, a dynamic web dashboard for manual control and configuration, and a Flask-based backend that manages real-time device status, scheduling, and command execution. Commands are validated against a centralized MongoDB Atlas database before execution to prevent redundant actions. A scheduling module supports both one-time and recurring events. Device control is carried out through ESP8266 and ESP32 microcontrollers communicating via the ESP-NOW protocol, ensuring fast, offline-capable operation. All interactions are logged for traceability. The system (100) is modular, scalable, and suitable for deployment in homes, institutions, and low-connectivity environments

(57) Abstract :

The humungous generation of kitchen wastes followed by their unscientific disposal has resulted in environmental pollution and solid waste management problems. The present study provides a sustainable and economical alternative by fabricating porous activated carbon (Kitchen waste@AC) from mixed kitchen waste by physical activation at 950°C. Characterization studies were employed via FTIR, FE-SEM EDX, XRD, and BET analysis techniques. BET analysis determined the mean pore diameter, surface area and pore volume of 3.8nm,580.82 m<sup>2</sup>/g, and 0.11 cm<sup>3</sup>/g, respectively. CIP was selected as a model adsorbate due to its extensive presence in water bodies and as result of which adverse impacts have been observed on the living biota. The optimization of CIP adsorption was carried out by varying adsorbent dosages (0.01-0.04 g/L), adsorbent concentrations (20-40 g/L-1) and aqueous pH of 1-11. The maximum removal capaci

(57) Abstract :

The present disclosure relates to a system (100) for autonomous rescue and data acquisition in disaster-affected environments, is disclosed. The system (100) comprises a chassis body (102) structured for traversal across unstable terrain, a terrain sensing unit (104) using light detection and ranging for spatial mapping, and a thermal imaging camera (106) to capture infrared radiation profiles. A sensor assembly (108) including acoustic and hazard sensors enables detection of survivor cues and hazardous conditions. A hybrid-electric locomotion assembly (110) powers a torque-controlled continuous track drive for multi-terrain mobility. A thermochromic surface coating (112) modulates thermal emission based on environmental input. A retractable antenna (114) facilitates secure directional data transmission. A computing device (116) receives and processes input from all sensors to construct a terrain model, identify human-compatible heat signatures, classify hazards, compute a traversal priority index, and regulate drive signals. Said computing device (116) generates and transmits encoded data to a ground station before retracting the antenna (114).

(57) Abstract :

A satellite launch system is disclosed that integrates magnetic levitation and spin launch technologies within a vacuum chamber to enable efficient payload deployment into Low Earth Orbit. The system utilizes a tether composed of silicon-carbide fibre reinforced titanium matrix composite, providing high tensile strength and thermal stability under extreme rotational loads. Niobium-Titanium (NbTi) superconducting wires embedded in the tether are cooled to 4.2 K and interact with electromagnetic coils generating a 2.5 Tesla field, powered by 5 MJ superconducting magnetic energy storage units. Propulsion is provided by Linear Induction Motors (LIMs) or Linear Synchronous Motors (LSMs), accelerating the tether to 900 RPM and 8,000 m/s<sup>2</sup>. The payload is released using a solenoid-actuated latch with piezoelectric precision. Radiative cooling panels and Invar spacers address thermal expansion. The system achieves a launch efficiency of 15 kWh/kg and complies with ISO 21360 and IEC 61000 standards, offering a scalable alternative to traditional launch methods.

(57) Abstract :  
The present invention relates to a system for providing personalized, secure, and real-time mental health support by integrating artificial intelligence (AI), blockchain technology, and Internet of Things (IoT) sensors. The system comprises an AI module employing a Retrieval-Augmented Generation (RAG) model to deliver context-aware therapeutic responses based on individual medical history, emotional state, and real-time physiological data. IoT-enabled wearable devices continuously monitor biometric parameters such as heart rate, blood pressure, sleep, and stress levels. The collected data is encrypted and stored on a blockchain ledger, ensuring user-controlled, tamper-proof data management. The system further includes a user interface for interactive communication and a dashboard for health visualization. Machine learning allows the AI to adapt responses over time. The invention provides a unified ecosystem for mental health care that is context-sensitive, privacy-focused, and evolutionarily intelligent, providing continuous, personalized support based on multidimensional user inputs.

(57) Abstract :  
The invention relates to a real-time helmet detection system designed to monitor and enforce helmet compliance among two-wheeler riders using artificial intelligence and computer vision. The system consists of high-resolution surveillance cameras, a video preprocessing unit, and a deep learning-based object detection model YOLOv5 or YOLOv8 trained to detect helmets, riders, and motorcycles within live traffic footage. Video frames are extracted, normalized, and analyzed to identify violations where a rider is not wearing a helmet. The system generates a violation log containing a timestamp, location data, camera identifier, and visual evidence. Optional features include automatic number plate recognition (ANPR), GPS integration, and dashboard-based reporting tools. Alerts are delivered automatically to traffic authorities via SMS, email, or API. The system supports both cloud and edge deployment, allowing flexible and scalable integration into urban or remote environments. The invention provides a fully automated, non-intrusive solution for enhancing traffic safety and law enforcement efficiency.

(57) Abstract :  
This invention presents a Nano-Enhanced Genetic Algorithm Framework for Quantum Circuit Optimization, integrating AI-driven evolutionary computing with nanotechnology-based quantum hardware to achieve fault-tolerant, high-efficiency quantum computation. The system employs Genetic Algorithms (GA) to iteratively evolve quantum circuits, optimizing gate sequences, qubit connectivity, and error correction strategies. It leverages self-assembled quantum dots, nano-patterned superconducting qubits, and topological materials to dynamically enhance qubit coherence and minimize decoherence effects. A hybrid quantum-classical co-processing model integrates a nanophotonic AI accelerator, enabling real-time feedback-driven optimization. Furthermore, adaptive quantum error correction (GA-QEC) evolves alongside circuit design, reducing the need for excessive physical qubits while maintaining computational integrity. This novel framework ensures cross-platform compatibility across superconducting, trapped-ion, photonic, and topological quantum computing architectures, making it a scalable, hardware-aware, and commercially viable solution for next-generation quantum processors.

(57) Abstract :  
The present invention relates to a self-predictable AI-based retinoscope configured to assess and predict ocular refractive errors in real-time. The device comprises a retinoscope unit, an image-capturing module, and an artificial intelligence-based processor that analyzes retinal reflex images and outputs predicted refractive power values. A graphical user interface is used to display the results in diopters including spherical, cylindrical, and axis components. The invention optionally includes cloud-based storage, wireless connectivity, distance sensors, and ergonomic design suited for pediatric screening. The system provides an accurate, automated, and non-invasive method for vision assessment without requiring skilled interpretation, thereby enabling widespread deployment in both clinical and remote healthcare applications.

(57) Abstract :

The present invention discloses a non-invasive, AI-powered system for predicting human blood groups using fingerprint patterns. A non-invasive system for predicting human blood group using fingerprint image processing, the system comprising: a fingerprint scanner configured to capture a fingerprint image of the subject; an FTDI USB-to-serial (101) connector enabling communication between said fingerprint scanner and a computing device; a computing device (102); a pre-processing software module stored in the computing device and executable by a processor; a feature extraction software module; a trained deep learning model and an output interface (103) configured to display the predicted blood group and a confidence score. The fingerprint scanner comprising: an optical Sensor (104) to capture the fingerprint image; a Digital Signal Processor (105) to process the raw image; a flash memory (106) to store the fingerprint templates; and a UART Interface (TX and RX pins) (107) to enable communication with FTDI connector.

(57) Abstract :

The present disclosure provides a system for autonomous hybrid-energy agricultural monitoring and precision irrigation. The system comprises a U-shaped telescopic chassis frame comprising a cross-member housing a pair of oppositely threaded lead-screw driven rails operatively coupled through a synchronous magnetic coupling assembly to vary a lateral track width. A pair of vertical legs incorporating lift actuators are pivotally connected to opposing ends of the cross-member. An environmental sensing unit comprises at least one selected from a thermochromic or an image-based sensor. A hybrid energy management unit comprises photovoltaic cells, hydrogen fuel cells, and a battery storage array. An energy control circuit dynamically switches between solar and hydrogen power sources. A processing unit analyzes environmental data and generates control signals. An irrigation dispensing unit discharges water in response to said control signals. A wireless communication interface transmits environmental data and irrigation status in discrete intervals to an external interface. Fig. 1

(57) Abstract :

Abstract Disclosed a wearable ocular screening system (100) for non-invasive glaucoma detection and risk evaluation comprises a spectacle-type frame (102) having right-side (106) and left-side (108) supports and a front lens support section (104). A piezoelectric pressure sensor (110) on the right-side support estimates intraocular pressure via eyelid deformation. An ocular Doppler optical sensor (112) on a lateral segment of the right-side support measures ocular blood flow, while an infrared ocular thermography sensor (114) on a forward-facing portion of the right-side support detects periocular temperature variations. Smart camera modules (116) on opposing ends of the front lens support capture photoplethysmographic signals and pupil responses. A LIDAR-based surface topography sensor (118) on the left-side support generates a corneal curvature map. A microprocessor (120), housed within the left-side support, receives all sensor data, segments optic disc/cup boundaries to compute cup-to-disc ratios, analyzes retinal nerve fiber layer thinning, compares temporal landmarks, and executes a trained decision model to compute a glaucoma risk score. A wireless communication interface (122) transmits the risk score and associated data to an external device.

(57) Abstract :

The present invention provides a dynamic, AI-driven platform for issuing, tracking, and trading water credits, based on verified real-time data from multiple water conservation and generation sources such as Atmospheric Water Generators (AWG), rainwater harvesting, Sewage Treatment Plants (STP), and household consumption reduction. Verified through IoT devices, the system employs machine learning models to dynamically adjust credit values based on environmental and market factors. All credits are immutably recorded on a blockchain ledger, supporting secure, transparent peer-to-peer trading and third-party integrations via APIs. The platform incentivizes sustainable water usage by gamifying user engagement and enabling integration with utility billing systems and corporate ESG frameworks. The invention fosters market-driven conservation practices applicable to both public and private sectors.

(57) Abstract :  
The present invention introduces a voice-controlled remote farming device that integrates advanced automation, real-time sensing, and Natural Language Processing (NLP) for precision agriculture. Utilizing a high-fidelity microphone and NLP algorithms, including Named Entity Recognition (NER) and intent classification, the system accurately interprets user voice commands. These commands are mapped to predefined farming procedures, dynamically adjusted through sensor inputs such as infrared (IR) for irrigation and light-dependent resistors (LDR) for field monitoring. The device generates executable task frames and autonomously carries out operations like seeding, irrigation, and harvesting. A feedback mechanism provides real-time updates on execution status, while adaptive algorithms optimize performance based on environmental data and historical trends. Machine learning further refines procedures over time, enhancing efficiency and sustainability. With a customizable command interface, multitask coordination, and robust power management, this device offers a comprehensive, user-friendly solution for modern farming, minimizing manual intervention and maximizing productivity across diverse agricultural environments.

(57) Abstract :

The present invention discloses a biodegradable hive coating for use in apiculture to protect beehives from pests and microbial infections. The composition comprises propolis extract, chitosan, beeswax, tree resins, essential oils, and a starch-based biopolymer. The coating is applied to the inner surfaces of the hive, where it forms a breathable, water-resistant, and antimicrobial barrier that degrades over 3–6 months. The invention provides a non-toxic, eco-friendly alternative to synthetic pesticides and supports sustainable beekeeping practices.

(57) Abstract :

The present invention discloses an intelligent IoT-based precision farming system for real-time crop health monitoring and automated nutrient management. The system comprises environmental, soil, and imaging sensors; a data analytics module powered by machine learning; and an actuator control unit interfaced with a smart fertigation system. It continuously monitors crop health, diagnoses nutrient deficiencies or plant stress, and executes real-time, site-specific nutrient application autonomously. The invention enables sustainable agriculture by optimizing input use, enhancing productivity, and reducing environmental impact.

(57) Abstract :

The present invention provides a ventilation system designed for closed poultry houses located in tropical climatic regions, where external temperatures often exceed 40°C. The invention addresses the critical need to maintain internal conditions within the ideal thermal comfort zone for poultry, between 25°C and 30°C, to ensure their health and productivity. The system integrates a water-based evaporator (such as a sprinkler mechanism) with a strategically positioned exhaust fan to achieve effective cooling and air circulation. The proposed configuration was designed and analyzed using ANSYS Computational Fluid Dynamics (CFD) software to simulate real-world heat transfer and airflow patterns within the poultry house. Four different models were evaluated through CFD simulations: (i) a base model with no evaporator or exhaust fan, (ii) a model with only an evaporator, (iii) a model with only an exhaust fan, and (iv) a hybrid model with both systems.

(57) Abstract :

The present invention relates to a Smart Self-Healing Road System that autonomously detects, analyzes, and repairs road surface damage using a combination of smart materials, embedded nano/micro-robotics, artificial intelligence (AI), and renewable energy technologies. A smart self-healing road system, comprising: a smart asphalt layer (101) embedded with microcapsules containing healing agents; a network of embedded sensors (102) configured to monitor parameters including strain, vibration, temperature, and pressure in real-time; an artificial intelligence (AI) processing unit (103); one or more nano- or micro-scale robotic repair units (104) embedded within or beneath the road surface, operable to perform localized repair upon receiving a signal from the AI unit; a renewable energy harvesting module (105) comprising solar panels and/or piezoelectric devices configured to power system components; and an IoT communication module (106) configured to transmit system status, repair activity, and diagnostic data to a central monitoring system.

(57) Abstract :  
The present invention relates to a cryogenic heat exchanger recuperator featuring a uniform crystal lattice structure fabricated from a Cu-Cr-Nb alloy. The integrated design eliminates conventional brazed or welded joints, reducing structural vulnerabilities and enhancing reliability under thermal cycling. Strategically engineered expansion and compression regions optimize fluid dynamics, improving thermodynamic efficiency through controlled pressure and velocity changes. The advanced Cu-Cr-Nb alloy offers superior thermal conductivity and mechanical strength at cryogenic temperatures. Inlet and outlet ports are positioned to leverage natural convection, enhancing heat transfer without additional energy input. The monolithic construction simplifies manufacturing, reduces cost, and increases durability compared to traditional multistream plate-fin heat exchangers. This innovation addresses the limitations of conventional designs, offering improved performance, reliability, and efficiency in extreme cryogenic environments, representing a significant advancement in the field of thermal energy exchange systems.

(57) Abstract :

The present invention provides a mechanical safety system for elevators to prevent accidental falls into the elevator shaft. The system (100) comprises a plurality of trapdoors installed at each floor level within the shaft, configured to remain closed when the elevator car is not present at the respective floor. A pulley-based mechanism, mechanically linked to the elevator car, controls the opening and closing of these trapdoors in synchronization with the elevator's vertical movement. As the elevator approaches a floor, the pulley system activates the corresponding trapdoor to open, allowing the car to enter. After the elevator departs, the trapdoor closes automatically using counterweights or springs. The system (100) is entirely mechanical, operates without electrical sensors or external power, and is suitable for retrofitting in existing elevator shafts. This invention offers a reliable and fail-safe method to enhance passenger safety and eliminate the risk of falling into an empty elevator shaft.

(57) Abstract :

The invention relates to a smart anti-snoring pillow system that detects and mitigates snoring through a combination of real-time audio monitoring, artificial intelligence-based snore pattern recognition, and automated physical feedback mechanisms. The system comprises an embedded microphone, a microcontroller running a snore detection algorithm, micro-vibration modules, and inflatable air bladders. Upon detecting snoring, the system delivers gentle vibrations or dynamically adjusts the shape of the pillow via air-cell inflation to encourage a shift in the user's head or neck position, improving airway alignment. Pressure sensors and AI learning algorithms enable personalized responses without disturbing sleep. A companion mobile app allows sleep data analysis, customization of settings, and firmware updates. The system provides a non-invasive, silent, and intelligent solution for individuals suffering from habitual snoring or mild obstructive sleep apnea.

(57) Abstract :

The present invention discloses a non-invasive, real-time system for heart rate monitoring and anomaly detection using facial video analysis and embedded edge processing. A non-invasive system for real-time heart rate monitoring and anomaly detection, comprising: a high-resolution camera (101) configured to capture facial video of a patient; an embedded processing unit (102) configured to extract photoplethysmographic signals from said facial video; a cooling fan (103); an external memory support (104); two ports (105) alternatively for the power supply and for connecting an external camera; two LED indicators (106) alternatively indicating the built-in camera and external camera; a tactile On/Off button (107); a pre-processing module; a deep learning model; a cloud-based alert software module for generating and transmitting alerts upon detection of abnormal heart rate values; a multi-bed detection module using YOLOv8; a pose estimation module (MediaPipe or equivalent) and an anomaly detection module.

(57) Abstract :  
The invention provides a switching system for n-channel enhancement-type MOSFETs that addresses leakage current and logic instability at nanometre-scale dimensions. It introduces a dual-polarity gate control mechanism wherein a positive voltage is applied to the Gate terminal during the ON state to induce conduction, and a negative voltage is applied during the OFF state to increase the potential barrier and suppress quantum tunneling. To further isolate the main logic circuit from residual minority carrier flow, an alternative conduction loop is introduced across the n-type regions on the opposite side of the channel, biased with a positive voltage during the OFF state. This loop diverts residual current away from the logic path, maintaining signal integrity. The system is designed with a logic threshold above the level of minority current, ensuring accurate switching. This configuration supports improved logic accuracy, thermal efficiency, and scalability in ultra-miniaturized integrated circuits used in high-density microprocessor applications.

(57) Abstract :

The present disclosure provides a system for autonomous emergency communication deployment in constrained environments. The system comprises a base enclosure having a top mounting surface, a power compartment, and an interface panel. A segmented telescopic antenna shaft having helicoidally guided polygonal segments is mounted on the top mounting surface. A planetary gear drive assembly generates axial extension and rotation of the segments. A universal joint with a tri-lobed flexure array allows directional redirection. A foldable radome assembly with a microfluidic bladder array is positioned over the antenna. A torsional recoil chamber facilitates passive retraction using stored rotational energy. A sensor skirt with capacitive, ultrasonic, and proximity sensors evaluates surrounding structures. A communication interface coupled to the antenna shaft, gear assembly, and power compartment enables bidirectional wireless transmission and deployment status indication through the interface panel. (57) Abstract :  
The present invention discloses a next-generation Battery Management System (BMS) for electric vehicles that integrates intelligent real-time health monitoring, predictive thermal control, and hybrid cell balancing. By combining federated sensor networks, an advanced microcontroller, and machine learning algorithms, the system offers precise estimation of battery state parameters and proactive fault detection. A hybrid balancing mechanism ensures charge uniformity while minimizing energy loss. Thermal safety is maintained through synergistic passive and active cooling strategies. Designed for scalability, this modular BMS supports diverse EV configurations ranging from 48V to 400V, enhancing both performance and safety in urban mobility solutions. Figure of abstract: FIG. 1.

(57) Abstract :

The present invention provides an intelligent assistive robotic system designed to support elderly individuals and persons with physical or medical challenges by integrating multiple assistive functions into a single, adaptive platform. The system comprises a morphing structural frame with articulated joints, enabling it to transform its configuration for various tasks such as mobility support, personal care, household assistance, and exercise guidance. The system includes non-invasive health monitoring sensors for tracking vital signs and fall detection, along with emergency alert capabilities. It features intuitive control interfaces including voice recognition, gesture recognition, and mobile application connectivity. The system further integrates with smart home infrastructure via wireless communication protocols, allowing environmental control. An embedded adaptive artificial intelligence module enables personalized support by learning user preferences, behaviors, and routines.

(57) Abstract :  
The present invention relates to an automated painting device that integrates image recognition and real-time motion control to enhance the precision of physical brush strokes. The system includes a motorized actuator with high-torque motors and a three-rod stabilization mechanism that enables multi-axis, fine-tuned brush positioning. A camera module equipped with image recognition algorithms such as edge and contour detection continuously monitors the canvas to detect boundaries and provide visual feedback. A roller mechanism with proximity sensors forms dynamic physical barriers, ensuring the brush remains within defined painting zones. The system also features a screen module for real-time user interaction, displaying painting progress and accepting control inputs. A feedback-driven control unit employing PID and adaptive algorithms regulates brush movement and corrects deviations in real time. The invention automates and enhances the accuracy of manual painting tasks, making it suitable for both artistic and industrial applications requiring consistent, high-precision output with minimal manual intervention.

(57) Abstract :  
The present invention discloses a wearable lie detection device in the form of a bracelet, configured to non-invasively monitor physiological parameters indicative of deceptive behaviour. The device integrates multiple compact biosensors, including an oscillometric sensor for blood pressure measurement, a photoplethysmography (PPG) sensor for detecting heart rate variability, a skin conductance sensor for assessing sweat response, and optionally a breath pattern detector. Data collected from these sensors is processed by an onboard artificial intelligence (AI) system, trained to identify physiological patterns commonly associated with lying. The AI-driven analysis eliminates the need for professional interpretation, enabling real-time, autonomous lie detection in a portable, user-friendly format. The invention overcomes the limitations of traditional polygraph systems by providing a compact, wearable and easy-to-use solution that can be utilized in everyday environments without expert assistance.

(57) Abstract :

The present invention relates to a compact, multi-functional self defense keychain, intended to provide enhanced protection in emergency situations. The keychain integrates multiple self-defense and alert mechanisms, including a retractable knife, pepper spray dispenser, electric shock module, loud alarm system, GPS tracking, Bluetooth connectivity and an emergency activation button. Upon activation, the device simultaneously triggers real-time location sharing, sends emergency alerts via Bluetooth to pre-configured contacts and emits a high-decibel alarm to deter threats and attract attention. It is lightweight, portable and user-friendly, allowing it to be carried conveniently on a keychain or clipped to personal belongings. Constructed with durable materials and powered by a rechargeable lithium-ion battery, the device ensures long-term reliability and operational efficiency. This invention offers a comprehensive and intelligent solution for personal security, particularly suited for individuals in vulnerable or high-risk environments, such as students, night workers and solo travellers.

(57) Abstract :  
The present invention discloses a machine learning-based system for predictive health diagnostics using multimodal data integration. The system acquires real-time health data from diverse sources including electronic health records (EHRs), wearable sensors, and patient-reported inputs. An ontology-driven semantic harmonization layer aligns this data using standard medical vocabularies. The diagnostic core employs an ensemble of machine learning models, including CNNs, LSTMs, and gradient boosting algorithms, to provide condition-specific predictions. To ensure interpretability, the system integrates Explainable AI (XAI) tools such as SHAP and LIME, generating feature-based justifications for each output. A feedback loop enables adaptive learning based on clinical validation. The system supports real-time monitoring, interoperates with existing health infrastructures via HL7/FHIR APIs, and is deployable across cloud and edge platforms for both institutional and personal healthcare applications.

(57) Abstract :

The present invention relates to a rooftop tile system integrated with miniature vertical-axis wind turbines (VAWTs) for converting wind energy into electrical energy. Each tile comprises a compact VAWT coupled to a micro-generator and a smart micro-inverter with Maximum Power Point Tracking (MPPT) 22 for efficient energy conversion. Conductive tracks embedded within the tile route the generated electricity to a centralized controller, battery, or building grid. The system optionally includes a piezoelectric support layer for harvesting vibrational energy, and integrated photovoltaic strips for hybrid solar-wind operation. Additional features include aerodynamic wind-guiding vanes, a self-cleaning nano-coating, drainage channels, IoT-based real-time monitoring, and protective systems such as lightning arrestors and thermal sensors. The invention offers a modular, low-noise, and aesthetically integrated renewable energy solution for urban and residential buildings, enhancing rooftop space utilization while contributing to decentralized and sustainable power generation.

(57) Abstract :

This nature-inspired clock visually reflects the progression of time through dynamic color transitions representing morning, midday, evening, and night. It utilizes RGB LEDs managed by a microcontroller synchronized with real-time data to ensure smooth, second-by-second transitions. The clock features aesthetically designed hands—a leaf-shaped hour hand, wave-shaped minute hand, and straight second hand—symbolizing growth, flow, and precision. It can be wall-mounted or adapted for wearable use. Powered by a rechargeable battery or an AC adapter, it includes adjustable brightness and may utilize eco-friendly materials. This innovative device combines aesthetics, functionality, and emotional well-being through visual synchronization with natural cycles.

(57) Abstract :

The present invention relates to a self-healing biodegradable medical implant equipped with AI-guided adaptive healing, bioinductive peptide coatings, and bioelectric stimulation for enhanced tissue regeneration and personalized recovery. A self-healing biodegradable medical implant comprising: a biopolymer matrix formed from biodegradable polymers including polylactic acid (PLA), polycaprolactone (PCL), or poly(lactic-co-glycolic acid) (PLGA); one or more embedded AI-powered biosensors configured to monitor biological markers selected from the group consisting of pH, inflammation indicators, oxygenation levels, and mechanical stress; a bioinductive peptide coating comprising functionalized peptides selected from RGD, BMP-2, or VEGF-mimetic peptides to enhance cellular adhesion, vascularization, and tissue regeneration; a conductive polymer network composed of electroactive biomaterials including PEDOT:PSS or polypyrrole; and an AI-controlled nanocarrier-based drug delivery system that autonomously dispenses therapeutic agents in response to biosensor data; wherein the implant dynamically adjusts its degradation rate, drug release, and bioelectric stimulation intensity based on patient-specific healing conditions.

(57) Abstract :

The present invention introduces an Attachable Universal Smart Module that automates the control of electrical appliances based on human presence detection. The device is designed to eliminate electricity wastage by ensuring appliances like lights, fans, and air conditioners operate only when a human is present. It integrates PIR (Passive Infrared) sensors, Ultrasonic sensors, AI-based tracking, and IoT capabilities to enhance accuracy and efficiency. Unlike conventional motion sensors, the system distinguishes between humans and other moving objects, reducing false activations. The plug-and-play module can be attached to any existing electrical appliance, making it a universal and cost-effective solution. Additionally, the AI-based adaptive learning feature analyzes user behavior to optimize energy usage over time. This smart automation system significantly reduces manual effort, enhances convenience, and promotes sustainable energy consumption in homes, offices, and industries.

(57) Abstract :

The present invention relates to an intelligent elevator control system that detects the presence of people inside an elevator cabin by using artificial intelligence and real-time video capture. The system identifies occupants with over 95% accuracy over its numerous high-resolution cameras and AI processing unit, which uses sophisticated image recognition algorithms. The control module optimizes elevator operation and energy efficiency by selectively enabling and disabling floor stop requests based on occupant detection. In the event of a camera or AI malfunction, a fail-safe mechanism guarantees continuous service by reverting to a default mode that responds to all floor requests. The system also includes manual override capabilities for emergency responders and regular self-diagnostics. The adaptive and configurable solution enhances elevator safety, efficiency, and responsiveness by intelligently managing operations based on real-time occupancy detection while maintaining robust fault tolerance.

## (57) Abstract :

The present invention relates to an IoT-enabled air purifying and carbon capturing device utilizing microalgae-based biofiltration for environmental remediation. The system comprises a photobioreactor chamber containing a liquid culture of photosynthetic microalgae configured to absorb carbon dioxide and release oxygen through photosynthesis. Ambient air is drawn into the system, where it passes through a gas-liquid interface that facilitates pollutant removal and CO<sub>2</sub> capture. An array of environmental sensors monitors parameters including CO<sub>2</sub> concentration, particulate matter, VOCs, temperature, humidity, and nutrient levels. A microcontroller processes this data to autonomously adjust airflow, lighting, and nutrient dosing for optimized system performance. The device includes a communication module for transmitting real-time air quality data to a remote platform via IoT. The system is modular, energy-efficient, and supports the harvesting of algal biomass for secondary applications, thereby promoting sustainable air purification and carbon management in indoor and outdoor environments.

(57) Abstract :

The method for the development of a revolutionary strategy for sustainable energy and emission reduction, especially for hybrid electric vehicles (HEVs), is the creation of an electrochemical reactor for the effective conversion of CO<sub>2</sub> into fuel. This work introduces a new reactor system that uses sophisticated electrocatalysts and tailored reaction paths to produce energy-dense fuels like formic acid or methanol from atmospheric CO<sub>2</sub> in ambient circumstances. The reactor is made to work in unison with HEV systems, reducing greenhouse gas emissions and offering an additional low-carbon fuel source. The reactor produces significant CO<sub>2</sub>-to-fuel conversion rates with little energy input thanks to its high Faradaic efficiency and low overpotential operation. The process's sustainability is further improved by the incorporation of renewable electricity. The system's feasibility for automotive applications is demonstrated by experimental findings, which support environmental and energy security goals. This work represents a major advancement in electrochemical innovation for cleaner transportation solutions and circular carbon technology.

(57) Abstract :

The widespread utilisation of organophosphate pesticides, such as chlorpyrifos, in agricultural activities has raised significant environmental risks, affecting aquatic life and human health. Adsorption has become a simple, economical, and environmentally friendly technique for removing such contaminants from water. Among several reported adsorbents, metal-organic frameworks (MOFs) have materialized as a supremely efficient adsorbent due to their high specific surface area, tunable chemical properties with high thermal and chemical stability, and multi-functionality in water remediation applications. In this study, two different metal-organic frameworks (Materials of Institute Lavoisier: MIL-100 (Fe) and Zeolite imidazole Framework: ZIF-8) were synthesized via simple and room temperature methods for the adsorption of chlorpyrifos (CHP). The fabricated adsorbents were characteri

(57) Abstract :

The present invention discloses an AI-integrated smart probiotic capsule system for personalized gut microbiome modulation. The system includes an ingestible capsule containing a customized probiotic formulation determined using artificial intelligence based on the user's gut microbiota profile. The capsule comprises a pH-sensitive coating for targeted release in specific regions of the gastrointestinal tract and includes biosensors for in vivo detection of gut biomarkers such as pH, redox potential, and microbial metabolites. The biosensor data is wirelessly transmitted to an external AI-based engine that analyzes the real-time gut conditions and triggers selective release of the microbial formulation through compartmentalized reservoirs within the capsule. The invention enables adaptive, data-driven, and personalized probiotic therapy using next-generation microbial strains and advanced delivery mechanisms. The system forms a closed-loop feedback architecture for individualized gut health optimization.

(57) Abstract :

The present invention discloses a green, biocompatible method for synthesizing formononetin-loaded silver nanoparticles (FMN-AgNO<sub>3</sub>-NPs) designed to overcome the pharmacokinetic limitations of free formononetin. Formononetin, a plant-derived isoflavone, exhibits neuroprotective, antioxidant, and anti-inflammatory activities, yet suffers from poor water solubility, low bioavailability, and limited blood-brain barrier permeability. The present invention synthesizes silver nanoparticles via chemical reduction using silver nitrate and trisodium citrate, followed by the incorporation of formononetin through ethanol-mediated mixing and thermal evaporation. The resulting nanoparticles exhibit spherical morphology, average sizes between 100–200 nm, high zeta potential for colloidal stability, and functional group interactions confirmed via FTIR. This formulation significantly enhances aqueous solubility, enables sustained release, facilitates brain targeting, and reduces systemic toxicity. The FMN-AgNO<sub>3</sub>-NPs present a promising nanomedicine platform for treating diabetes-associated cognitive decline and other neurodegenerative conditions. The invention is scalable, eco-friendly, and suitable for pharmaceutical application in central nervous system drug delivery.

(57) Abstract :

An AI-powered consumer product safety scanning system that evaluates the health risks and legal compliance of food, cosmetics, and related products. The system gathers visual information about the product using a multi-angle image capture module and a rotating scanning platform. Text, symbols, and ingredient information are extracted using Optical Character Recognition (OCR) and integrated AI algorithms. A pre-trained health and regulatory database is cross-referenced with this data in order to assess possible risks, prohibited substances, and adherence to FDA, EU, and FSSAI standards. Real-time reports on ingredient safety, regulatory status, and recommended substitutes are shown on a mobile application interface. The AI model is being continuously improved by users interacting with the system, offering feedback, and reporting false product claims. The present invention enhances consumer awareness and safety through automated, intelligent product analysis accessible in everyday settings.

(57) Abstract :

A method (300) and system (100) of identifying false positives of security vulnerabilities in a codebase thereof is disclosed. A processor (104) determines at least one function corresponding to a plurality of components (120) vulnerable to security risk. The plurality of components (120) are in a plurality of configurations. A plurality of parameters corresponding to the at least one function by using a machine learning engine (110) are extracted. The codebase with the plurality of parameters of the at least one function determines if at least one parameter of the at least one function exists within the codebase to identify a security vulnerability is analyzed. A non-existence of the plurality of parameters of the at least one function in the at least one parameter of the component (120) within the codebase is determined. A false positive of the security vulnerability of the component (120) of the codebase is identified. [To be published with FIG. 1]

(57) Abstract :

The present disclosure provides a portable water quality monitoring system for remote areas, comprising a multi-channel analog front-end unit, a plurality of sensors configured to measure water quality parameters including pH, Total Dissolved Solids (TDS), turbidity, and temperature, a LoRa E5 module for data transmission, a battery with an integrated management system, and a solar cell configured to charge the battery. The system enables continuous monitoring of water quality in remote locations such as overhead tanks, ponds, and rivers, with long-range data transmission capabilities and sustainable power management for extended operation in off-grid environments.

(57) Abstract :

An orthopedic ankle rehabilitation device, comprising a wearable body 101 comprising two U-shaped support units 102 connected by a stretchable strap 103 that conforms to the ankle for targeted compression and stabilization, a miniature air pump 104 inflate multiple air-cushion patches 201 along with multiple rubberized air-pads 105 for providing cushioning and comfort to the user, a camera 106 detect inflammation and abnormal heat patterns, multiple Peltier units providing targeted heating therapy, multiple micro-pored patches 202 releasing relieving solution stored in a vessel 107 to provide therapy, a flexible circular member 203 equipped with multiple rubberized spikes 204 to apply light pressure for stimulate blood flow and reduce pain, multiple therapeutic spots 205 arranged with an expandable conduit and a multi-sectioned chamber 108 to dispense the liquid to targeted areas for relieving inflammations, a microphone 109 allow user to provide voice commands for requirement of heel support.

(57) Abstract :

A child safety and supervision device, comprising a mobile body 101 installed with motorized wheels 102 for autonomous movement and positioning, a plurality of high-sensitivity cameras 103 identify individual(s) and monitor movements of the individual(s), multiple vertically oriented foldable flaps 104 each connected to body 101 via motorized hinge joints 105, and equipped with motorized omnidirectional wheels 106 that provide multi-directional movement on ground surfaces, a water safety unit assisting in aquatic safety and mobility, multiple motorized hinge fold legs 107 to allow aquatic adaptation of body 101, an inflatable bag 108 linked to an air inflator 109 that inflate the bag 108 to provide buoyancy, multiple motorized propellers 110 provide thrust and enable controlled movement of body 101 over the water surface, a robotic arm 111 having a circular ring net 112 affixed at a distal end, to deploy and retract for gently trapping identified animal without causing harm.

(57) Abstract :

The present invention discloses real-time face tracking system (100) that integrates computer vision with servo motor actuation using microcontroller-based control. The system comprises a webcam (102) for capturing live video feed, a face detection module (104) for identifying human faces using Haar cascade or DNN models, and a coordinate mapping unit (106) for converting face position data into angular values. A microcontroller unit (108) receives these values via a communication interface (110) using the pyfirmata protocol and actuates a horizontal servo motor (112) and a vertical servo motor (114) to align the camera with the detected face. A real-time tracking controller (116) manages synchronized operation to maintain sub-200 ms latency, visual feedback display (118) overlays tracking indicators on the live video stream and alert system(120) generates alert upon successful detection of a human face. The system is cost-effective and adaptable for surveillance and robotics applications. Reference Fig 1

(57) Abstract :

The present invention discloses an intelligent mobile charging and tracking case that integrates wireless charging, real-time GPS tracking, and an emergency SOS alert system into a single protective unit. Designed for universal smartphone compatibility, the case features a Qi-standard wireless charging coil, a concealed SOS switch, a GPS module, and a GSM communication unit, all powered by an internal rechargeable battery. Upon SOS activation, the system transmits the user's location and a distress message to pre-selected contacts. The present invention includes a companion mobile application for configuring emergency settings, viewing live location, managing alerts, and monitoring device health. Additional features include fall detection, tamper sensing, geofencing, and LED status indicators. The multi-functional case enhances personal safety, ensures connectivity in remote or crisis scenarios, and eliminates the need for multiple standalone devices which offers a compact, reliable, and user-friendly solution ideal for travelers, students, outdoor enthusiasts, and individuals in high-risk environment.

(57) Abstract :  
The present invention discloses an autonomous, AI-powered inspection system for photovoltaic (PV) panels utilizing aerial drones, robotic crawlers, and handheld kits equipped with a tri-modal multi-spectral sensor suite. Each unit captures visible (400–700nm), thermal (3–5μm), and electroluminescence (950nm) imagery, processed via an onboard quantized hybrid CNN-Transformer model with sub-20ms latency. The system integrates RTK-GPS for centimeter-level navigation, obstacle avoidance radar, and a multi-spectral fusion engine for high-precision defect detection. Over 63 PV defect types are classified with >94% accuracy, and crack geometries are reconstructed at ≈500 pts/cm². A predictive maintenance module forecasts degradation up to 12 months in advance. Reports are generated per IEC standards and transmitted via API to SCADA systems. Blockchain integration ensures secure audit trails and federated learning enables continuous, privacy-preserving model updates. The system enables real-time, high-resolution diagnostics and actionable maintenance insights without requiring manual data handling or cloud-based processing.

(57) Abstract :  
The present invention discloses an artificial photosynthesis system designed for sustainable energy production by converting sunlight, carbon dioxide (CO2), and water (H2O) into renewable energy carriers such as hydrogen and methanol. The system comprises a high-efficiency light-absorbing module incorporating perovskite-sensitized metal-organic frameworks (MOFs) to enhance solar photon capture across a broad spectral range. A photocatalytic layer embedded with biomimetic and metal-based catalysts, encapsulated within nanoscopic oxide shells, enables selective and stable water splitting and CO2 reduction. A dual-chamber photo-electrochemical reactor, partitioned by a proton exchange membrane (PEM), independently facilitates oxygen evolution and fuel generation under precisely regulated conditions. The system integrates transparent conductive substrates, real-time sensor arrays, and an adaptive control unit for autonomous operation. A modular, scalable reactor design supports plug-and-play deployment and seamless integration with existing infrastructure. Life Cycle Assessment (LCA) metrics are embedded in the design to ensure long-term environmental and economic sustainability.

(57) Abstract :

The present invention relates to a novel toroidal bioreactor, which is a suitable system for the enhancement of microbial and cell culture applications. Covered with a toroidal main chamber and vertical sides, the bioreactor provides a curved inner surface that guarantees fluid circulation and elimination of dead spots. The invention utilizes orbital motion to facilitate a traveling wave in the culture medium, thereby creating an efficient mix without the use of internal mechanical agitators. By providing low shear, wave-mixed conditions within the bioreactor, conditions are suitably optimized for shear-sensitive cells to increase diffusion of oxygen, nutrient supply, and cell health. The bioreactor is flexible, supporting various operational modes: batch, fed-batch, and perfusion – and it fulfills the prerequisites for this CIP/SIP. The modular scalability of the bioreactor makes it suitable for effective industrial-scale bioprocessing processes. This technological revolution improves cell and microbial culture efficiency by maximizing mechanical simplicity and improving hydrodynamics.

(57) Abstract :

The present invention disclosed a portable digital spirometry device with an ergonomic handgrip, detachable mouthpiece, integrated airflow sensors, and a cylindrical body with a digital screen for real-time pulmonary function assessment. In order to compute important spirometric parameters such as Forced Vital Capacity (FVC), Forced Expiratory Volume in 1 second (FEV1), and Peak Expiratory Flow (PEF), the device records and analyzes inhalation and exhalation data. When predetermined respiratory targets are met, audiovisual alerts are activated, and results are shown instantly on the digital screen. For the purpose of tracking past data and tracking lung function over time, the system has onboard memory. Users are further assisted in receiving performance feedback by a visual ball-based airflow indicator. Designed for ease of use in clinical and home settings, the device enables accurate, repeated respiratory assessments and supports diagnosis, monitoring, and treatment of pulmonary disorders.

(57) Abstract :  
The present invention discloses an edge-AI-based obstacle detection and vehicle control system designed for autonomous or semi-autonomous vehicles. The system integrates a multi-camera array comprising stereo and wide-angle monocular sensors, a high-performance low-power AI processor, and hybrid depth estimation combining stereo disparity and monocular prediction. An onboard tracking engine continuously updates obstacle state vectors and estimates time-to-collision with high precision. A motion planning module evaluates multiple trajectories in real time to ensure safe vehicle navigation, while a fail-safe mechanism autonomously initiates emergency maneuvers in case of low confidence or processing delay. The method enables robust detection of over 120 obstacle classes in diverse environmental conditions, including low-light and rain, while maintaining a total system power consumption under 15?W. The present invention ensures enhanced situational awareness, fast response, and reliable obstacle avoidance for next-generation vehicles operating in complex environments.

(57) Abstract :

The present invention relates to a Wireless Electronic Notice Board System designed to enable real-time, remote, and secure display of information using dual-mode wireless communication. The system integrates a microcontroller unit (ESP32, Arduino, or Raspberry Pi) with Bluetooth and Wi-Fi/GSM modules 102 to receive messages from a mobile application or web portal. Users can transmit messages locally via Bluetooth or remotely via cloud platforms such as Firebase, AWS, or Thingspeak. A display unit, such as an LED matrix or e-paper screen, renders messages in scrolling or static formats. The system features encrypted communication using AES or RSA, and access is controlled via role-based authentication. It supports cross-platform compatibility and multi-board synchronization for centralized management. Designed for energy efficiency and minimal maintenance, it is suitable for educational institutions, smart campuses, offices, and public spaces. This paperless solution ensures timely, eco-friendly, and tamper-resistant information dissemination in dynamic environments.

(57) Abstract :  
The present invention discloses an AI-powered through-wall detection and weapon classification system designed for real-time surveillance and threat identification in military and security operations. The system integrates a 77 GHz millimeter wave radar with a Multiple Input Multiple Output (MIMO) antenna configuration and an embedded artificial intelligence processing unit capable of executing deep neural networks, including convolutional neural networks (CNN) and bidirectional long short-term memory (BiLSTM) networks. The radar module, operating on a Frequency Modulated Continuous Wave (FMCW) waveform, penetrates non-metallic barriers and captures range-Doppler-angle data to detect and classify human presence and concealed weapons. The AI subsystem performs spatial and temporal analysis of radar returns to accurately differentiate between armed and unarmed individuals, and to identify weapon types such as rifles, handguns, and explosives. The system supports real-time visualization, low-latency inference, environmental adaptability, and multi-modal sensor fusion with optional LiDAR and acoustic inputs.

(57) Abstract :

The present invention discloses a wearable or portable device for gesture-based navigation path sharing using augmented reality (AR). A wearable device for gesture-based navigation path sharing using augmented reality (AR), comprising: a processor operatively coupled to a memory; an optical displacement tracking module configured to record spatial navigation paths based on user movement, wherein the optical displacement tracking module comprises at least one image sensor and at least one depth-sensing unit; a gesture recognition module; a natural language processing (NLP) unit configured to process contextual voice commands for modifying or annotating navigation paths; an augmented reality rendering unit configured to overlay navigation paths, landmarks, and directional cues within a user's field of view; a feedback mechanism comprising haptic and/or auditory output for real-time user guidance and environment-based corrections; and a cloud-connected synchronization module configured to transmit, store, and share navigation path data with other devices.

(57) Abstract :

The present invention relates to an Internet of Things (IoT)-based modular and scalable framework for real-time air quality monitoring and data analytics, designed to be low-cost, portable, and easily deployable in resource-constrained environments. The system integrates affordable air quality sensors with open-source software components including Node-RED for data preprocessing, Telegraf for high-speed ingestion, InfluxDB for time-series data storage, and Grafana for real-time visualization. Sensor data is transmitted via the lightweight MQTT protocol, ensuring reliable communication even over low-bandwidth networks. The architecture is fully modular, enabling independent upgrades or replacements of components without disrupting system functionality. The entire solution operates efficiently on standard laptops or edge devices with limited computing resources, making it ideal for rural, educational, and community-level deployments. By eliminating the need for specialized infrastructure and technical expertise, the invention democratizes access to accurate environmental data, fostering informed decision-making, public awareness, and proactive environmental management at scale.

(57) Abstract :

An electrostatic hair comb that effectively detangles hair while catching loose strands to stop them from scattering. The device ensures smooth and gentle grooming with its long-lasting comb teeth composed of recycled plastic and an eco-friendly bamboo fiber composite. When a spring-loaded button mechanism is used to activate a piezoelectric plate embedded behind the comb teeth, static electricity is produced, creating an electrostatic field that draws loose hair. The drawn hair is gathered and kept in a built-in chamber with a handy latch for effortless disposal. By safely directing the static charge toward hair attraction, electrical insulation protects users from the possibility of electric shock. The present invention combines sustainable materials with an innovative static charge generation system, providing a hygienic, user-friendly, and environmentally conscious solution for hair grooming and loose hair management.

(57) Abstract :

The present invention relates to Smart Adaptive Tinting Shield utilizing Polymer Dispersed Liquid Crystal (PDLC) technology for dynamic regulation of transparency in vehicle and building windows. The system is configured to automatically adjust the tint level based on real-time inputs from motion and light sensors. In vehicular applications, the invention ensures compliance with legal visibility standards while in motion and transitions to full opacity when stationary to minimize solar heat gain and ultraviolet exposure. In architectural settings, the system dynamically darkens or clears windows in response to sunlight intensity, thereby enhancing indoor comfort and reducing energy consumption. The tinting shield integrates a microcontroller unit, low-power electronics and optional solar power support, along with a mobile application for manual override. This invention offers a rapid-response, energy-efficient, and legally compliant alternative to conventional static or slow-reacting smart glass solutions.

(57) Abstract :

An adaptive balance training device is disclosed, comprising a balance board equipped with a detachable, height-adjustable support stick to provide progressive stability assistance. The board includes a dual-stage pivot system enabling multi-axis tilt with adjustable resistance to accommodate varying skill levels and training goals. Embedded sensors, including gyroscopes and accelerometers, deliver real-time performance feedback to a companion mobile application. The device further includes a 360-degree rotating handle for ergonomic gripping, an anti-slip surface for enhanced user safety and curved perimeter edges to reduce fall risk. Designed for use across rehabilitation, general fitness, and advanced athletic training, the system allows users to customize tilt, resistance and support for a tailored balance training experience.

(57) Abstract :  
The present invention discloses a self-assisting gym spotter system integrated into a stable bar cage structure designed to enhance safety and performance during compound exercises such as squats, bench presses and deadlifts. The system includes hydraulic-powered spotting arms equipped with intelligent load sensing technology, enabling real-time detection of exerted force and adaptive adjustment of rebound support. A central processing unit (CPU) processes user inputs and sensor data to dynamically control the spotting response. The system further includes an automatic latching mechanism that activates upon detecting full load, ensuring secure transition from spotting to independent lifting. This configuration replicates the function of a human spotter, allowing users to perform repetitions safely until failure while retaining the benefits of free-weight training. The invention delivers a personalized and responsive workout experience, significantly improving safety, efficiency and user confidence.

(57) Abstract :

The invention relates to “Hybrid Thermos Flask” integrating functionalities of a traditional flask and an electric kettle into a single, portable unit that is designed to heat and maintain the temperature of liquids without the need for a separate heating device. It features a built-in heating element located at the base of the flask, powered by a rechargeable 15,000mAh battery and alternatively, through a direct plug-in option. The flask's smart features include temperature control, water level sensors and a digital display, allowing users to set and monitor the heating process. Additionally, the flask is equipped with a companion mobile application, enabling remote control of the temperature and usage tracking. The Hybrid Flask aims to address the inconvenience of carrying separate devices for storing and heating water. This innovation offers a compact, energy-efficient, and user-friendly solution, enhancing the convenience of heating and consuming hot liquids on the go.

(57) Abstract :

The present invention discloses an intelligent disaster prediction and management system that integrates IoT-based sensing, edge processing, secure communication, AI/ML analytics, and blockchain-backed logging to enable real-time, resilient, and transparent disaster response. The system comprises distributed sensors monitoring seismic, weather, and hydrological parameters, which are analyzed locally for anomalies and transmitted securely via low-power wide-area networks. Centralized AI models predict disaster risks and guide dynamic allocation of emergency resources. A mobile/web application provides users with real-time alerts and safety instructions, while a closed-loop feedback mechanism continuously refines the models using post-event data and user inputs. All operational logs are immutably stored on a blockchain to ensure tamper-proof accountability. The system ensures proactive risk mitigation, rapid decision-making, and trustworthy disaster governance, especially in resource-constrained or connectivity-challenged environments.

(57) Abstract :  
The present invention discloses a compact, ultra-dense, and quantum-secured data storage system utilizing engineered nanoparticles arranged in a customizable three-dimensional grid. Each nanoparticle functions as a quantum data unit, encoding information via spin states, charge states, and photonic emissions. Quantum-access interfaces, such as nitrogen-vacancy centers and quantum dots, enable precise and authenticated data operations through Quantum Key Distribution (QKD) or entangled photons. The device supports non-destructive data retrieval using laser excitation and fluorescence-based interrogation. An integrated AI module facilitates intelligent data search, optimization, and pattern recognition. The system is being embedded in personal electronics, medical monitoring tools, or structural materials, offering real-time sensing and secure data logging. Designed for high security, durability, and environmental adaptability, the present invention is ideal for applications in healthcare, defense, smart infrastructure, and long-term archival. The hybrid platform represents a next-generation approach to intelligent, secure, and scalable data storage beyond classical memory technologies.

(57) Abstract :

Quantification of phenol and their related enzymes was studied in Lentil (lens culinaris medic) infected with Fusarium oxysporum F. Sp. lentis causing wilt disease. The contents of total lipid and lipase activities in healthy and diseased counter parts of lentils were measured. Different plant parts showed variation in their phenol contents were recorded higher in wilt infected plant then healthy leaf, stem, fruit and seeds while lipase activities were recorded higher in normal leaf, stem, fruit and seeds as compared to infected plant.

(57) Abstract :  
Disclosed are an electrolyte and a vanadium redox flow battery. The electrolyte comprises a positive electrode electrolyte and a negative electrode electrolyte, and the positive electrode electrolyte and the negative electrode electrolyte contain chloride ions, sulfate ions and vanadium ions. The positive electrode electrolyte and the negative electrode electrolyte both satisfy:  $2.9=[c(Cl^-)+c(SO_4^{2-})]/c(Vn^+)=3.6$ , wherein  $c(Cl^-)$  represents the concentration of the chloride ions,  $c(SO_4^{2-})$  represents the concentration of the sulfate ions, and  $c(Vn^+)$  represents the concentration of the vanadium ions. When  $Cl^-$ ,  $SO_4^{2-}$  and  $Vn^+$  in the electrolyte satisfy a suitable concentration relationship, the output rate of  $Cl_2$  can be greatly reduced, thus reducing corrosion of battery materials; in addition, a small amount of evolved  $Cl_2$  can compensate for the oxidation of battery electrode carbon felt, thereby achieving the effect of protecting the electrode carbon felt, and lowering the risk level of a chlorine-containing electrolyte work environment.

(57) Abstract :

The present invention relates to an AI-powered smart food matching and redistribution system designed to reduce food wastage and combat hunger. It connects food donors—such as restaurants, grocery stores, and individuals—with recipients like NGOs and shelters through mobile and web platforms. The system uses machine learning algorithms to analyze food type, quantity, shelf life, location, and recipient needs, enabling real-time, optimized matches. It features urgency scoring, geolocation filtering, and a feedback-driven learning loop to continuously enhance performance. By automating logistics and matching, the invention ensures efficient, equitable, and sustainable food distribution.

(57) Abstract :

The present invention relates to an AI-powered personalized e-learning assistant that integrates semantic knowledge graphs with a LangGraph-orchestrated multi-agent framework to deliver highly adaptive and intelligent learning experiences. It constructs a dynamic learner model based on prior knowledge, learning goals, preferences, and real-time performance, stored in a Neo4j-based knowledge graph. Specialized agents—such as onboarding, curriculum planning, content recommendation, assessment, and feedback agents—collaborate through a state-aware control flow to guide the learner's journey. Integrated Large Language Models (LLMs) generate personalized quizzes, feedback, and explanations, simulating the role of a human tutor. The system continuously refines its recommendations by updating the learner model with each interaction, enabling responsive, scalable, and domain-independent learning support across K–12, higher education, and professional training platforms.

(57) Abstract :

The present invention relates to a cost-effective, an environmentally friendly, a biodegradable, an efficient composite membrane for removing dyes from a wastewater, and an easy, a cost effective, an ecofriendly and an industrially scalable process for preparation thereof. The composite membrane of the present invention is a transition metal oxide nanoparticle-embedded polymeric membrane, wherein fabrication of said composite membrane is accomplished by a green method without employing organic solvents. In addition, the embedded nanoparticles are prepared by the green synthesis method by replacing organic solvent with distilled water and by using natural material like walnut husk powder extract for bio-reduction and bio-oxidation of the transition metal ions and preparation of transition metal oxide. Therefore, the composite membrane and the process of preparation thereof offer a green and sustainable approach for removal of dyes from the wastewater.

(57) Abstract :

The present invention relates to a smart gardening glove system designed for real-time plant health monitoring through direct physical contact. The glove comprises embedded optical sensors located on the thumb and touch sensors integrated into the glove fabric to assess key plant parameters such as moisture content, texture, nutrient status, and disease indicators. A processing unit collects and analyzes data from the sensors, while a natural language processing (NLP)-based system interprets the results and generates actionable plant care instructions. The glove provides real-time feedback via visual, haptic, or mobile interfaces. Additional features include a calibration module for maintaining sensor accuracy, a data logger for historical tracking, and a rechargeable battery with power optimization. The system supports multilingual output and can integrate with mobile applications for extended functionality. This invention offers a compact, wearable solution to enable efficient, accurate, and adaptive plant care for both professional horticulturists and amateur gardeners.

(57) Abstract :

The present invention relates to a smart, solar-powered street lighting system designed to enhance road safety in hilly and mountainous regions with poor visibility due to fog, sharp curves, and limited electricity access. The system integrates solar panels, rechargeable batteries, energy-efficient LED streetlights, high-intensity laser guidance modules, and motion sensors. In day time the solar panels charge the battery, which powers the LED and laser modules at night. The laser lights project visible guidance lines onto the road surface, improving lane visibility in low-light or foggy conditions. Motion sensors detect approaching vehicles or pedestrians, triggering illumination only when needed, thereby conserving energy. The system provides a reliable, eco-friendly, and cost-effective solution ideal for remote or disaster-prone areas, significantly reducing accident risks and improving night-time navigation on challenging terrains.

(57) Abstract :

The present invention provides a road accident detection and alert system for vehicles which comprises a drowsiness detection module, an alcohol detection module, a road accident detection module, and a pothole detection module. The combination of said modules prevent mishaps occurring while driving a vehicle. The system of the present invention alerts the user while he/she is feeling drowsy or the alcohol consumption rate is higher than standard. The system also alerts nearby help center if the user met with an accident while driving. Further, the system also notifies the user regarding upcoming potholes on the road thus, allowing the user to slow down the vehicle and drive safely. Fig 3

(57) Abstract :

The present invention provides a system for analyzing context-based privacy requirements comprises a communication device comprising a user interface, display unit, and a storage unit; a plurality of input data from two or more user interfaces for monitoring user's activity by means of the communication device; a plurality of computerized optimizer modules for analyzing and monitoring user's activity by means of the said communication device; and a computerized trained privacy preservation model for preventing breaching of the user's privacy. The said system in conjunction with the said computing device, analyses and processes the input data to monitor user's activity and privacy requirement parameters, and then acquires the requirement parameters and effectively selects the computerized trained privacy preservation model by investigating the adaptability and behaviour of the selected privacy preservation model. The present invention solves the problem of the breaching of the user data on various e-commerce platforms by creating a computerized trained privacy preservation model. Fig 1

(57) Abstract :

The present disclosure provides a system (208) and a method for mitigating page failure and reducing paging load in a cellular network. The system (208) may establish a connection with a user equipment (204) to facilitate a context setup. Upon the context setup, the system (208) may receive a Tracking Area Identity (TAI), a cell identifier, and cell and Radio Resource Control (RRC) status information from the user equipment (204). The system (208) may determine a transition in location of the user equipment (204) based on the TAI, the cell identifier, and the cell and RRC status information, and update location information of the user equipment (204) in a database associated with the system (208). Further, the system (208) may page the user equipment (204) based on the location information of the user equipment (204) to mitigate page failure and reduce paging load in a cellular network (206).

(57) Abstract :

The present disclosure provides a system (208) and a method for mitigating page failure and reducing paging load in a bandwidth constraint cellular network. The system (208) may establish a connection with a user equipment (204) to facilitate a context setup. Upon the context setup, the system (208) may receive a Tracking Area Identity (TAI), an Evolved Universal Terrestrial Radio Access (EUTRA)-cell identity, and cell and Radio Resource Control (RRC) status information from the user equipment (204). The system (208) may update a list of cells visited by the user equipment (204) based on at least one of the TAI, the EUTRA-cell identity, and the cell and RRC status information. Further, the system (208) may page the user equipment (204) based on the list of cells visited by the user equipment (204) to mitigate page failure and reduce paging load in the bandwidth constraint cellular network.

(57) Abstract :

The fast-paced and digitized contemporary world faces the security of data protection and its integrity as a major issue and to combat the said problem the present invention discloses a computational framework that incorporates homomorphic encryption schemes together with the zero-knowledge proof mechanism. This framework performs the encryption of sensitive data in order to increase its security in a cloud environment. The framework is built on RSA cryptosystem multiplicative homomorphism properties together with Paillier additive homomorphism cryptosystem so that secure operations can be performed on encrypted data directly. Privacy-preserving multiplication operations are allowed by RSA while the addition is enabled by Paillier which operates over encrypted numbers. Zero-knowledge proofs offer an extra layer of security on both operations since they allow verifying computation correctness without disclosing any private content. By using these techniques computation overhead is reduced. Further, with the combination of multiple techniques in the computation process, the system offers enhanced security and privacy, facilitating multiparty computation, and promoting interoperability and adoption.

(57) Abstract :

The present invention discloses a comprehensive system for managing and reporting attendance, enhances accuracy and provides real-time monitoring of attendance based on Radio Frequency Identification (RFID) technology. The present invention aims to develop an RFID-based attendance monitoring and reporting system that utilises Raspberry Pi (RPI) for processing the scanned data. Each individual is assigned with a unique RFID tag which can be embedded in a card or keychain, and is read by RFID readers connected to the Raspberry Pi. The system processes the collected data in real-time, ensuring quick and accurate attendance recording. The Raspberry Pi acts as the central processing unit, managing data storage, analysing data and communication with external devices. The use of Raspberry Pi offers advantages such as low cost, energy efficiency and an open-source platform, making the system affordable, sustainable and accessible to a wide range of organizations. Key features of the system include its scalability, adaptability and user-friendly interface. It is designed to support a large number of users, making it suitable for organizations of varying sizes. Its adaptability facilitates easy integration with existing infrastructure, reducing implementation challenges, the user-friendly interface ensures that the both administrators and end-users can easily navigate and interact with the system, enhancing its practicality and usability.

## (57) Abstract :

The present disclosure provides an advanced wearable tracking device using a long-range communication module which is a life saving tool that can be used for search operation and locating disaster affecting people. The present invention uses the LoRa module as a communication module to transmit input data and to establish a secured communication pathway to a distance from 5km to 15km using less energy and bandwidth. The device of the present invention comprises a plurality of long-range based receiver nodes; a plurality of long-range based transmitter nodes; a processing unit; a communication device; a plurality of sensors; a voice activated module; an emergency button; a cloud based server for storing the data; a power source for powering the said device; a location tracking module; and a plurality of jumping wires. The said device of the present invention allows the rescue team and authority to locate and obtain live status of the user's health parameters with the help of a secured long-range communication module.

The present disclosure relates to a system 102 and a method 300 for monitoring an Automatic Tensioning Device (ATD). The system 102 includes one or more sets of sensor-reflector units 108 connected to a set of pulleys 128 of the ATD 104. The sensor-reflector units 108 are configured to measure variations in at least an X parameter and a Y parameter of the ATD 104 in real-time. The system 102 includes a control unit 110 coupled to the one or more sensor-reflector units 108. The control unit 110 is configured to collect data pertaining to the variations in the X and Y parameters from the sensor-reflector units 108, detect one or more anomalies in the overhead power cable 122 by monitoring the variations in the X and Y parameters, and generate and transmit an alert to a user equipment 124 associated with the system 102 based on the detection of the one or more anomalies.

FIG. 1

|                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

(57) Abstract :  
The present invention relates to an artificial intelligence based oral cancer diagnosis device (100). The device (100) comprises a data collection module, a preprocessing module, a convolutional neural network (CNN) model, a validation and testing module, an integration module, an regulatory compliance module and an user interface. The data collection module configured to gather a dataset of oral images. The preprocessing module ensure uniformity and reduce noise. The convolutional neural network (CNN) model trained on the preprocessed dataset to identify and classify different stages of oral cancer. The validation and testing module that evaluates the model's performance using separate validation and independent test datasets to determine accuracy, sensitivity, specificity, and other relevant metrics. The user interface that allows healthcare professionals to upload oral images and receive diagnostic results. The integration module designed for seamless compatibility with existing healthcare systems. The regulatory compliance module ensuring the device meets standards

(57) Abstract :  
ABSTRACT MOTOR-DRIVE FOR ELECTRIC VEHICLES The invention pertains to a motor-drive (100) for an electric vehicle. The motor-drive (100) comprises a common rotor shaft (102) for integrating a motor and a gearbox, a rotor (104) comprising at least one endplate (106) and a rotor core (108). The rotor core (108) comprises at least one slot (110) on an inner diameter configured to lock the at least one endplate (106). FIG. 1

(57) Abstract :

The present disclosure provides an advanced and portable women safety device. The present invention aims towards providing a safety device which is portable and easy to carry and can differentiate between emergency and abnormal situation based on the monitored parameters and machine learning algorithm. The said device comprises a plurality of sensors (4), a processing unit (1), a push button (2), a location tracking module (3), a location tracking module (3), an alarming buzzer (6), a shock circuit (7) (18) of the said device, a position and navigation detecting module, a user application (8), a wireless communication module for transmitting input and output data. The said device allows the user (woman) to defend herself from the attacker by pre pressing the said push button of the said device which generates electric shock if an emergency condition is detected that may weaken the strength of the attacker, giving an opportunity and a short time to the user to escape herself from the attacker.

(57) Abstract :

The present invention relates to a system and method for detecting pneumonia in the children early by classifying chest X- ray images using convolutional neural network which is a famous deep learning technique used to classify the X-ray images efficiently and provide high accuracy. In the present invention convolutional neural network is designed to detect pneumonia from chest X-ray images. The CNN model is trained on a labeled dataset to achieve high accuracy and robustness. By optimizing the architecture layers and employing data augmentation methods, the model's performance in classifying pneumonia is enhanced. The model is tested on invisible X-ray images to ensure reliable diagnosis, providing a quick and accurate tool for early detection and treatment of pneumonia. The system's primary goal is to recognize cases of pneumonia and differentiate between healthy lungs and pneumonia infected lungs on chest X-ray images.

(57) Abstract :

The present invention is a resume-screening model that addresses the inefficiencies and subjectivity in existing resume-screening methods by proposing the development of an AI-based system. Manual screening is challenging for recruiters, leading to biased selections and the potential loss of qualified candidates. The need for automation arises to effectively evaluate resumes, rank candidates based on job relevance, and overcome issues related to time efficiency, standardization, bias reduction, and scalability. The present invention relates to an AI-based resume-screening system by software implementation that begins with data pre-processing by using Python libraries and applying data cleaning techniques to eliminate noise and irrelevant information from both resumes and job descriptions. Following the data pre-processing, the next phase involves model training. Two primary approaches are employed for the purpose of model training. Firstly, the Multinomial Naive Bayes classifier is trained using the pre-processed data to predict the relevance of resumes to specific job positions and secondly, the K-nearest neighbour (KNN) algorithm is applied to classify similar resumes based on their features. Upon completion of model training, the system proceeds to integration. This entails the development of APIs (Application Programming Interfaces) to facilitate communication between the user interface and the backend model. Finally, the integrated system is deployed either on a web server or a cloud platform to ensure accessibility for recruiters and stakeholders. The final phase of the software implementation involves testing and evaluation to assess the system's functionality and effectiveness. Furthermore, end-to-end testing is performed to evaluate the performance and usability of the resume screening system under various scenarios. Evaluation metrics such as accuracy, precision, recall, and F1-score are utilized to assess the system's effectiveness in identifying relevant candidates and providing accurate recommendations.

(57) Abstract :

In system and method disclosed herein, an advanced framework for accelerated skill transfer is presented through a human-to-human neural interface operable in both synchronous (real-time/online) and asynchronous (offline) modes. The framework enables the neurophysiological encoding and transfer of motor skills from a trainer to a trainee by leveraging brain-computer interface (BCI) and neuromuscular stimulation technologies integrated with machine learning algorithms. In the training phase, neural activity patterns corresponding to specific motor intentions or skill executions are captured from expert trainers. These signals then undergo signal pre-processing, followed by feature extraction and classification using advanced machine learning or deep learning models tailored for spatio-temporal neural data. In the skill transfer phase, the classified and semantically mapped neural command set is used to generate corresponding neuromuscular stimulation sequences. The stimulation targets specific motor neurons or muscle groups, eliciting physical movements in the trainee that mimic the trainer’s intended motor activity.

(57) Abstract :

The present invention provides a pet monitoring robotic device which comprises a robotic chassis comprising two pairs of robotic wheels and stepper motors; a plurality of sensors for sensing surrounding environment data; a processing unit comprising a microcontroller, storage unit, and a display screen; a power source module; two or more DC motor driver boards; two or more DC motors; a relay module; connecting wires; an image capturing module; a virtual network computing (VNC) graphical user interface; a solid and a liquid dispensing food containers; and a movable slide mounted at the base of the said food container operably rotated by a servo motor for dispensing the stored food into a feeding bowl. The present invention enables the user to monitor his/her pet activities in real time, and better verbal communication with the pets. An automatic feeding and monitoring system is also disclosed in the present invention. Fig 1

(57) Abstract :  
AI-POWERED DECISION SUPPORT SYSTEM FOR REAL-TIME STRATEGY AND PRODUCT PLANNING The present invention discloses an AI-powered decision support system designed for OEMs to enhance competitive strategy and new product planning. The system accepts natural language inputs regarding desired vehicle features, markets, and budgets, and converts them into structured data using advanced NLP models. Integrated with real-time and historical datasets, the system applies predictive analytics to forecast market trends and performance, and prescriptive analytics to optimize feature selection, pricing, and launch strategy using genetic algorithms and constraint programming. Interactive dashboards visualize forecasts and actionable recommendations, enabling informed, data-driven decisions. Scenario testing and simulation modules evaluate multiple market outcomes, while a feedback module continuously improves model accuracy based on post-launch results. The system ensures secure API-based integration with enterprise systems and complies with data protection regulations such as GDPR and ISO 27001. It offers a scalable, adaptive solution for OEMs and Tier-1 suppliers seeking real-time market insight and reduced time-to-market.

(57) Abstract :  
“SYNERGISTIC BIOACTIVE COMPOSITION TO IMPROVE JOINT HEALTH” The present invention relates to the field of nutraceuticals, specifically to a synergistic bioactive composition designed to improve joint health. This composition comprises Palmitoylethanolamide (PEA) and Cucumis sativus, aimed at reducing joint pain and protecting cartilage. It addresses the complex pain components of osteoarthritis, including both nociceptive pain, which stems from ongoing joint inflammation and tissue damage, and neuropathic pain, which indicates nerve damage. This nutraceutical composition provides a novel solution for mitigating the debilitating effects of osteoarthritis through oral administration, utilizing pharmaceutically acceptable excipients to ensure efficacy and safety.

## (57) Abstract :

The present invention relates to a thrust vector-controlled single-rotor UAV mono-flight system that emulates reusable rocket dynamics through its integrated components: communication module, microcontroller, BLDC motor, MEMS with accelerometer and gyroscope, power management module, actuators, flight controller, sensors, and control surfaces. Utilizing a 3D-printed spherical external structure, the flight controller executes commands from a ground station via the communication module for stabilization and thrust vectoring. Control surfaces, actuated by servo motors, enable altitude and direction control, while a client-server communication architecture facilitates remote operation. The system's single rotor and four control surfaces allow for pitch, roll, and yaw control. The PLA-printed external structure houses components, with a battery elimination circuit reducing weight. A custom PCB integrates components efficiently. A quaternion-based attitude control system provides stability, with a Q-P Attitude Controller and PID controllers adjusting control surfaces. This system, mimicking reusable rockets, enables precise maneuvering and is suitable for educational and real-world applications. This thrust vector-controlled single-rotor UAV mono-flight system offers a novel approach to emulate reusable rocket dynamics, facilitating remote control and precise maneuvering and its integrated design and control systems provide a platform for educational projects and real-world applications in a secure setting.

(57) Abstract :

BSTRACT TITLE: INORGANIC SOIL CONDITIONER FOR ENHANCING FERTILITY OF ALKALINE SOIL. 5 Disclosed herein is a inorganic soil conditioner which is a effective source for enhancing the phosphorus nutrient to growing plant. The inorganic soil conditioner comprises egg shell oxalic acid which is an acidic extract containing both acid and calcium oxalate. Presence of both together causes increase in the availability of phosphorus in soil at acidic and alkaline pH value of soil so that decreases cost, time 10 and labors for operation

(57) Abstract :

The present invention relates to a system featuring a multi-motor hovercraft for improved navigation and maneuverability. The system comprises a plurality of high-RPM (revolution per minute), motors (108) and (109), a propeller (401) a power supply unit (103) having a rectifier (104) and regulator (105), a microcontroller (100), a receiver module (102), a servo motor (107) integrated with a rudder (404). The system (800) works in conjunction with the existing hovercraft's propulsion and lift mechanisms, using continuous adjustments of both the servo and propeller motors to achieve the desired trajectory and to achieve the required performance. The engine at the back of the hovercraft spins at a very high RPM, allowing it to generate enough power to keep it above the surface, reducing friction underneath and the generator mounted on the back of the hovercraft helps it to propel it forward and by integrating a servo motor (107) with the rudder (404) to control the direction of movement by adjusting the angle of airflow thereby enhancing the maneuverability and navigation capacity of the hovercraft system (800).

(57) Abstract :  
ABSTRACT AUTOMATED DEACTIVATION OF TURN INDICATORS The present disclosure describes a system (100) for switching off a turn-indicator of a vehicle. The system (100) comprises at least one sensor (102) configured to sense a current value of linear acceleration and a current value of angular velocity of the vehicle. The system (100) comprises a processor (104) configured to calculate a current value of lean angle and a current value of yaw angle, determine a threshold value of lean angle and a threshold value of yaw angle dynamically, based on speed of the vehicle, compare the current value of lean angle and yaw angle with the threshold value of lean angle and yaw angle, and generate a signal to turn off the turn-indicator (108) based on comparison between the current values and the threshold values of the lean angle and the yaw angle. (57) Abstract :  
ABSTRACT: A MULTIFUNCTIONAL BLIND STICK The present disclosure provides a which multifunctional blind stick which comprises an integrated pulse oximetry and heart rate monitor module; an adjustable dial with Braille engraving for customizing the sensitivity of obstacle detection based on individual preferences and environmental conditions; an SOS button integrated with a global positioning system (GPS) module for alerting the user and emergency contacts and requesting assistance during emergency situation; a camera module; a micro processing unit; one or more ultrasonic sensors; a plurality of ports; a roller tip for enhancing comfort, stability, and ease of movement for the users while using the said stick; a wrist strap for preventing the stick from falling if accidentally released from the user hand wherein the said stick provides health parameters related data to the user in real time and on regular basis. The said stick generates tactile feedback sensations which are produced by integrated ERM (eccentric rotating mass) motors, allowing the user to quickly response to obstacles or change the walking direction and navigate more confidently and independently.

(57) Abstract :  
ABSTRACT: AN ADVANCED FACIAL RECOGNITION ATTENDANCE MANAGEMENT SYSTEM The present disclosure provides an advanced facial recognition attendance management system which aims at automating attendance tracking in various industries like educational institutes, private sector, and factories etc. The said system is designed to streamline and enhance attendance tracking procedure more accurately without any error and significantly improves efficiency in attendance management of above- mentioned areas. The system comprises a central processing unit for processing data input; an image capturing module for capturing a plurality of facial images and videos of a user for marking the attendance of the user; a power supplying module for powering the said system; a plurality of computer generated instructions; an open source database system for storing attendance records and facilitating efficient data querying; and an intuitive interface for remotely managing and sorting attendance data. The system of the present invention represents a significant advancement in attendance management at various levels, offering a secure and efficient solution to tackle problems related to attendance management procedures

(57) Abstract :  
ABSTRACT WIRING HARNESS AND METHOD OF MANUFACTURE THEREOF The present disclosure describes a spring-action busbar assembly (100) for grounding a shielded cable (102). The spring-action busbar assembly (100) comprises a spring-type busbar (104) configured to encircle a metallic shield (106) of the shielded cable (102), and adapted to exert a controlled pressure on the metallic shield (106) to ensure electrical contact, a connection means (108) integral to the busbar (104) configured to secure the busbar (104) to a grounding point and an extended grounding path (110) comprising a wire or a conductive element (112) configured to connect the busbar (104) to a remote grounding point when a local grounding point is unavailable. The spring-type busbar (104) is configured to provide a secure and continuous grounding connection. FIG. 1

**(57) Abstract :**

**ABSTRACT METHOD AND SYSTEM FOR CRASH DETECTION OF ELECTRIC VEHICLE(S)** The present disclosure describes a system (100) for detecting a crash of a vehicle. The system (100) comprises at least one Inertial Measurement Unit (IMU) sensor (102) configured to sense multi-dimensional inertial data of the vehicle, a vehicle communication interface (104) configured to retrieve vehicle operational data from a Controller Area Network (CAN), a data processing unit (106) communicably coupled to the IMU sensor (102) and the vehicle communication interface (104), and an output interface (108) communicably coupled to the data processing unit. Further, the data processing unit (106) is configured to cluster correlated multi-dimensional inertial data and vehicle operational data into a plurality of operating states, with each operating state representing a discrete behavioral condition of the vehicle. (57) Abstract :  
ABSTRACT SYSTEM AND METHOD FOR REAL-TIME VIDEO STREAMING OF TRANSPORTATION The present disclosure discloses a system (100) and method (200) for real-time video streaming of transportation. The system comprises a user interface (127) configured configured to allow a traveler to select from a list of available transportation modes, a data acquisition module (101) gathering real-time, historical, and predictive transportation data from diverse sources (102), a data processing module (104) refining data through AI-driven cleaning (105), mapping (106), and insight generation (107), and a content generation module (108) producing multilingual, interactive content with 3D map overlays. A screen capturing module (114) converts this into video streams, enhanced with overlays (116) and audio (117), followed by an encoding and streaming preparation module (118) that encodes (119), segments (120), and encrypts (121) streams for security. A multi-platform streaming module (122) delivers (123) low-latency broadcasts to varied platforms, while a monitoring and scalability module (124) optimizes performance (125) and scalability (126).

(57) Abstract :

A system (200) for an electromagnetic compatibility (EMC) testing is disclosed. The system (200) comprises at least one motor mount structure (102), a primary pulley (124), a secondary pulley (126), plurality of castor wheels (106), a driving wheel (108), a chassis dynamometer roller (110), a ground plane (112), plurality of dampers (114) enclosed in an ALSE chamber (116). The chassis dynamometer (110) rollers are used to transfer power and torque to the Electric traction motor (118) and in turn load the E-motor (130) along with the controller (120). The chassis dynamometer (110) is loaded using existing electronic control arrangement.

(57) Abstract :

The present disclosure provides an advanced door lock system which prevents a keyless access to the unauthorized person and alerts the user regarding the same by sending an alert notification along with captured images of the said unauthorized person on the communication device. The system comprises an image capturing module; a fingerprint scanning module for scanning fingerprints of an authenticated person; a processing unit; a transistor; a voltage regulator; one or more capacitors; one or more diodes; one or more resistors; a wireless transmission module; a power supply module; a communication device; and one or more LED lights. The system prioritizes data security and privacy, with encrypted communication and secure storage of access logs. The system represents a significant advancement in access control technology, offering an elegant and sophisticated solution for securing and managing access to properties. It caters to the increasing demand for convenient and secure access control while aligning with the principles of modern smart living.

(57) Abstract :  
The present invention provides a smart pet travel cage (200). The smart pet travel cage (200) has an enclosure (10) with ventilation panels (70) and an insulating layer (40) to regulate internal temperature. The GPS module (50) is embedded within the insulating layer and enables real-time location tracking for security and anti-theft protection. Further, the smart pet travel cage (200) includes a compartment (60) that can be expanded from a wall (11), a removable tray (100) for easy cleaning, at least one quick-release buckle (90) for emergency access, a shoulder strap (120) for manual carrying of the smart pet travel cage (200), and at least one reflective safety strip (80) for visibility in low-light conditions. The smart pet travel cage (200) enhances travel convenience, comfort and owner peace of mind through advanced design and integrated smart features.

## (57) Abstract :

An expandable intramedullary nail (100) is provided. Expandable intramedullary nail comprises housing (102) comprising first end (120), second end (124), first side part implemented as tapered surface(s) (206), second side part implemented as expandable fin(s) (212) perpendicular to second end at resting configuration and angular to second end at implanted configuration of expandable intramedullary nail, and sliding slot(s); front head (104) adapted to engage with housing for insertion of expandable intramedullary nail into femoral neck of user from femoral head ; sliding element (106) adapted to slide, into sliding slot(s) (136) to achieve implanted configuration of expandable intramedullary nail; and occluder (108) adapted to fit into housing to seal implanted configuration of expandable intramedullary nail. Disclosed also is an expandable intramedullary nail (600) adapted to be inserted into femoral neck of from femoral shaft. Expandable intramedullary nail comprises housing (602) and sliding element (604) adapted to slide into the housing.

## (57) Abstract :

The present invention discloses an automated and smart AI-based system for detecting respiratory disease using coughing sound in crowded areas. The system integrates the video input device [111] and the audio input device [112] to capture both video and audio data. The camera records the video data to identify coughing persons, while the microphone captures coughing sounds, and analyzed using higher-order spectra features at noisy environment by differentiating coughing sound and non-coughing sound. The recorded data is processed using signal processing techniques, such as framing and windowing, and analyzed with a Convolutional Neural Network (CNN) model to determine if a person is infected or not. The results are stored and transferred to a cloud-based database through a communication and graphical user interface module [121]. The system then notifies medical staff via an audio output device [113] on the user interface device [114] like dashboards or mobile devices. This early detection system helps reduce disease spread and ensures timely treatment.

(57) Abstract :  
“AN EQUIPMENT FOR MAGNETIC RECANALIZATION OF BENIGN BILIARY STRICTURES” The present invention relates to an equipment for magnetic recanalization of benign biliary strictures. Said equipment (100) includes a wire-guided magnet pusher tube (102a), atleast one magnet (110), and a magnet retrieval tube (102b). The equipment (100) works in conjunction with a visualization system to guide placement of the magnet (110) at the target site for recanalization og the biliary stricture. Said magnet (110), may be deployed at opposing ends of a biliary stricture to create a controlled recanalization channel via magnetic attraction. The deployment process can be performed using endoscopic retrograde cholangiopancreatography (ERCP), percutaneous transhepatic biliary drainage (PTBD), or a combination of both. Magnets may be retrieved following recanalization using biopsy forceps or allowed to pass naturally through the digestive tract, avoiding permanent implantation. Real-time imaging techniques such as fluoroscopy and cholangioscopy aid in precise targeting and monitoring of the treatment site. Figure 1.

(57) Abstract :

The present invention generally relates to a dual-band in-band full-duplex antenna system designed for efficient signal transmission and reception in two distinct frequency bands. The system comprises a substrate with two antennas fabricated at opposite ends in the same plane. The first antenna operates in a first frequency band, while the second antenna operates in a second frequency band. Each antenna features a microstrip slot radiator with slot elements, resonator elements, and a defective ground structure (DGS) integrated into the ground plane for enhanced performance. Independent feed lines are provided for each antenna to enable signal transmission and reception at the respective frequency bands. To ensure superior isolation between the two antennas and minimize interference, a row of metallic vias is positioned between them. This innovative design is compact, efficient, and suitable for applications requiring high isolation and reliable dual-band operation in full-duplex communication systems.

(57) Abstract :  
Methods and systems for controlling Permanent Magnet Synchronous Machine (PMSM) Motor 5 10 15 Embodiments herein disclose a method for controlling the PMSM motor (590) using hall sensors. The method includes estimating, by a transition block (530), a rotor position in the PMSM motor (590). Further, the method includes determining, by the transition block (530), a transition point between control modes based on an instantaneous torque ( $\tau_e$ ) and an average torque ( $\tau_{avg}$ ) produced by the PMSM motor (590). The control modes comprise a first (quasi-square wave current control) mode and a second (Field-Oriented Control (FOC)) mode. Further, the method includes triggering, by the transition block (530), an appropriate controller based on the state of flags from a position error sub-block (610) and a torque sub-block (630) between control modes based on operational factors. Further, the method includes enabling, by the transition block (530), a smooth transition between control modes to minimize torque ripples. FIG. 14

The current invention pertains to a system and method for the automated generation of personalized prompts and expressive listening, facilitating real-time, adaptable human-computer interaction. The system incorporates multimodal interaction processing, merging voice analysis, facial expression recognition, and natural language processing (NLP) to accurately evaluate user intent and emotional conditions. By employing hierarchical database indexing, smart data compression, and a self-learning feedback system, it consistently adjusts to changing user preferences, enhancing context-sensitive response generation. Significant developments comprise non-intrusive dialogue state monitoring, organized metadata for emotion assessment, and flexible caching methods to improve processing efficiency. Created for use in client assistance, AI-based education, psychological health support, and virtual helpers, the system offers emotionally aware, tailored engagements. By utilizing real-time annotation, synchronization, and modular AI-driven structures, it guarantees high precision in identifying emotional states while reducing false positives and improving scalability, accuracy, and interaction across various user contexts. (57) Abstract :  
The present invention relates to an advanced drone system (100) designed for extended aerial monitoring with both tethered and untethered operation modes. It features a tethering power module (101) that connects to a ground power station for uninterrupted operation, while a battery module (103) ensures autonomous functionality when untethered. A high-resolution 4K camera (105) mounted on a stabilizing gimbal (104) provides real-time, stable video capture. The system (100) includes an obstacle detection and avoidance module (108) for safe navigation in complex environments. A power mode switching unit (102), managed by an onboard power management unit (PMU), enables smooth transitions between power modes. Additionally, a payload module (107) supports heavy equipment integration, and a high-intensity light source (106) enhances surveillance in low-light conditions. This system (100) ensures reliable, continuous monitoring across diverse operational settings. (to be published with figure 1)

## (57) Abstract :

**ABSTRACT:** AN IoT BASED WATER OPTIMIZATION SYSTEM FOR AN OVERHEAD TANK The present disclosure provides an IoT based water optimization system for an overhead tank. The present invention focuses on providing an equal amount of water at different levels of a building in a controlled manner from the overhead tank. Further, the system of the present invention automatically opens or closes said valves (600), (800) based on automatic calculations, and maintains the designated flow rate regardless of changes in primary pressure. The said system comprises an overhead tank (100); a water level sensor (200) to send information regarding water level in the said overhead tank; an analogue to digital converter (300) for converting analog signals into digital; a microprocessor unit (400) for processing sensed data; a display module (500) for displaying the automatic calculations; a pressure regulator valve (600) for regulating pressure; a flow metre (700) for calculating the flow of the water through a plurality of valves; a constant flow valve (800) for maintaining the constant flow of water; and an alert module.

(57) Abstract :

**ABSTRACT: AN INTEGRATED UNDER SINK WASTE CRUSHER SYSTEM** The present invention provides an integrated under sink kitchen waste crusher system. This solution is highly cost-efficient, reduces overall waste volume, minimizes landfill usage, and promotes composting. The said system comprises of a dual sink for segregating kitchen waste and washing utensils separately; a wet waste basin for receiving wet kitchen waste, the said basin is covered with a rubber flap; a plurality of sensors; a stainless steel crusher unit; a power supplying unit for powering the said system; an alert module comprises of a sound buzzer and LED light to alert the user; a processing unit; a sealed pipeline framework system for transferring crushed waste and liquid compost to a centralized composting unit; a plurality of suction pumps for preventing clogging of waste; a user interface for remotely monitoring the operation of the said system. By promoting composting and reducing landfill dependency, the system contributes to lower greenhouse gas emissions and reduced environmental pollution.

(57) Abstract :

A process for preparing polyurethane (PU) resin using bio-based polyol is provided. The bio-based polyol is polyetheramide polyol (PEAP) derived from niger seed oil (NO). The process involves a single-stage aminolysis reaction to convert NO into Niger Fatty Amide (NFA), which is further reacted with tetrabromobisphenol A (TBBPA) to produce PEAP. The prepared PEAP is utilized to form a high-performance PU resin. The resulting PU resin exhibits enhanced thermal stability, with a glass transition temperature (Tg) above 100°C, improved mechanical strength, chemical resistance, and durability. The process is sustainable and cost-effective, reducing reliance on petroleum-based polyols, contributing to eco-friendly coatings, adhesives, and industrial applications while maintaining excellent performance. The resulting high-performance PU resin is applicable in protective coatings, high-durability foams, strong adhesives, lubricants, and industrial sealants, offering enhanced thermal stability, mechanical strength, and chemical resistance for diverse applications.

## (57) Abstract :

Disclosed is a stem neck trial component (100) comprising a slider element (102), a femoral head element (104), and a neck element (106). The slider element has: a stem (108) having an offset slot (110) that has an engagement element (112); a flange portion (114); an indicator slot (120) passing through the stem; and an indentation (124) formed circumferentially around the flange portion. The femoral head element has a hollow spherical dome (126); and a projection (202) formed corresponding to the indentation of the stem. The neck element has an elongate structure (132) comprising a slider slot (140), an offset indicator slot (142), a through-recess (146); an interlocking arrangement (134) that is arranged within through-recess; and a broach attachment element. Herein, a mechanical disengagement of interlocking arrangement allows linear movement of slider element in slider slot to adjust an offset between femoral head element and broach, when in use.

(57) Abstract :  
A cemented femoral stem (100) with detachable centralizer wings is provided. The cemented femoral stem (100) comprises a femoral stem body (101) and a set of centralizer wings (200). Each centralizer wing of the set of centralizer wings (200) is detachably attached to the femoral stem body (101). A distal part (102) of the femoral stem body (101) includes a set of slots. Each side of the distal part (102) includes a pair of slots of the set of slots. The pair of slots at each side of the distal part (102) includes a first slot and a second slot. The pair of slots of the set of slots at each side of the distal part (102) are interconnected. The first slot is positioned above the second slot. Each centralizer wing of the set of centralizer wings (200), after insertion through the first slot, locks into the second slot.

(57) Abstract :  
The present invention relates to a robotic shuttle system for automated pallet storage and retrieval. A first motor gearbox (1.1) drives X-axis (1.6) and Z-axis (1.12) travel through a dual output gearbox (1.1.2), intermediate gearboxes (2.1, 2.6, 2.8), and power transmission components (2.2, 2.3, 2.10). A second motor gearbox (1.2) with a lifting mechanism (1.4) raises or lowers the chassis using cranks and follower wheels (3.3) to engage either X-axis wheels (1.7) or Z-axis wheels (1.8). Alignment is ensured using guide rails (1.9.1, 1.9.2), and the top plate (1.14) provides structural support. The robot interfaces with a Vertical Reciprocating Carriage (VRC) and operates within a matrix racking system for high-throughput material handling. The dual-mode drive system reduces power consumption, enhances mobility, and optimizes warehouse storage through coordinated movement in X and Z axes.

(57) Abstract :

The present invention relates to a method for preparing a polyherbal wound healing ointment. The ointment comprises a synergistic blend of Vata (Ficus benghalensis), Udumbara (Ficus racemosa), Ashwatha (Ficus religiosa), Plaksha (Ficus lacor), Parisha (Thespesia populnea), Neem (Azadirachta indica), Manjishta (Rubia cordifolia), and Raktchandan (Pterocarpus santalinus), incorporated into a beeswax base with Vitamin E as a natural preservative. These components work collectively to enhance wound contraction, prevent infections, reduce scarring, and promote collagen synthesis. The formulation is non-adherent, minimizing trauma during dressing changes, and is suitable for chronic wounds, diabetic ulcers, burns, post-surgical wounds, pressure sores, and other dermatological conditions. The manufacturing process involves decoction, oil infusion, and controlled blending, ensuring optimal bioavailability of herbal extracts. This invention provides a safe, effective, and natural alternative for wound management

(57) Abstract :  
The present disclosure relates to a robot system (100). The robot system (100) includes a plurality of storage modules (200), and a mobile unit (300) adapted to move and position below the plurality of storage modules (200). The mobile unit (300) is adapted to move based on at least one of a predefined instructions, detach from the storage module (200) upon receiving the predefined instruction, detach the storage module (200) from the wall based on the predefined instruction, and carry the storage module (200) to a predefined location to execute the predefined instructions and couple the storage module (200) to the wall. The mobile unit (300) includes a plurality of solenoid locks (302) to extend and lock the storage module (200) with the mobile unit (300). The locking of the solenoid locks (302) enables the locking of the mobile unit (300) with the storage module (200). <>

ABSTRACT AN AQUEOUS BIOCIDAL COMPOSITION The present disclosure relates to an aqueous biocidal composition and its non-therapeutic use for controlling and/or killing a pest present at a locus. The aqueous biocidal composition is applied to at least a portion of the locus. The aqueous biocidal composition comprises polyalkyleneoxide modified heptamethyl tri-siloxane in a range of 0.2 to 2 % w/w and dimethyl sulfoxide in a range of 0.03 to 0.05% w/w. (57) Abstract :

The present invention relates to UV-Visible spectroscopy based chemometrics technique for identification and differentiation of closely related species of Sariva plant namely Decalipus hamiltonii, Hemidesmus indicus, Cryptolepis buchnani and Ichanocarpus frutescene. The spectral data of the closely related species of Sariva plant namely has been acquired by UV-Visible spectroscopy and then pre-treated by chemometrics. The chemometrics methods after spectral analysis, assists in converting the complicated spectral data into the easily readable data that becomes easy for differentiation of the closely related species of Sariva plant. The technique in the present invention can enhance the quality assessment and authentication processes, ensuring the integrity and efficacy of herbal products.

## (57) Abstract :

The present invention relates to a tool for recording the posterior palatal seal (PPS) region, essential for enhancing denture retention. The device includes a charging wire (101) for power supply, an Arduino microcontroller (102) for signal processing, a flex sensor (103) to differentiate between hard and soft tissues, a probe (104) for application on the palate, and a buzzer with a green LED light (105) for real-time feedback. The tool operates by detecting mechanical vibrations of the palatal tissue using the flex sensor (103), converting them into electrical signals processed by the microcontroller (102). Upon detecting soft tissue, the buzzer and green LED light (105) provide auditory and visual alerts, while an indelible pencil marks the identified PPS area. Data captured is stored in the system and can be exported for analysis. The device ensures accuracy, ease of use, and patient comfort, significantly improving PPS recording and denture retention.

(57) Abstract :  
“A SYSTEM AND PROCESS FOR REAL TIME ADMINISTRATIVE STRESS AND MENTAL HEALTH EVALUATION” The present invention relates to a ADMINISTRATIVE STRESS AND MENTAL HEALTH Monitoring and Feedback System (100) for continuous mental well-being assessment. The system includes a wearable or smart device (201) with an integrated camera and audio module (202) to capture facial expressions, voice patterns, and biometric data. A data acquisition unit (203) processes and forwards the data to a processing module (204) for analysis by a machine learning unit (205), which evaluates emotional states, stress levels, and social isolation indicators. A biometric monitoring module (206) tracks physiological parameters such as heart rate and skin conductance. A feedback module (207) provides real-time insights, while an alert mechanism (208) notifies a supervisor or counselor (209) if stress crosses a threshold. FIG. 2 depicts a user (401) interacting with a smart device (409) for ADMINISTRATIVE STRESS AND MENTAL HEALTH monitoring. The system ensures secure, real-time ADMINISTRATIVE STRESS AND MENTAL HEALTH tracking and personalized interventions via encrypted communication. [ABSTRACT TO BE PUBLISHED WITH FIG.2]

(57) Abstract :

ABSTRACT INTELLIGENT VEHICLE DETECTION AND ALERT SYSTEM FOR ROAD SAFETY IN HILLY AREAS USING ULTRASONIC SENSOR, LED, AND BUZZER The present invention relates to an intelligent vehicle detection and alert system and method for road safety in hilly areas, comprising: an ultrasonic sensor configured to measure a distance to an approaching vehicle and detect its presence within a predetermined critical zone; a microcontroller operatively coupled to the ultrasonic sensor, configured to process distance data and generate control signals based on a predefined distance threshold; a light-emitting diode (LED) operatively coupled to the microcontroller, configured to emit a visual alert when the vehicle is detected within the critical zone; a buzzer operatively coupled to the microcontroller, configured to emit an audio alert when the vehicle is detected within the critical zone; wherein the system is configured for low-power operation suitable for remote and off-grid locations. Refer Fig. 1.

(57) Abstract :  
ABSTRACT HANDHELD CONTACTLESS PAPER DETECTION SYSTEM USING CAPACITIVE AND INFRARED SENSORS The proposed Handheld Contactless Paper Detection System is an advanced, security and document protection solution that leverages both capacitive and infrared (IR) sensing techniques to detect concealed paper-based materials. The system comprises a capacitive sensing module, which distinguishes paper from other materials such as fabric or plastic based on permittivity/capacitance differences, and an infrared sensing module , which analyzes the material's IR absorption and reflection properties for enhanced accuracy. These sensors are interfaced with a central processing unit that implements an embedded algorithm to evaluate the sensor data and confirm the presence of paper. Upon detection, the system activates an integrated alert mechanism comprising a buzzer, LED indicator. Designed to implement in both handheld and fixed formats, the system offers scalability and adaptability across various deployment scenarios. The handheld configuration is optimized for portable inspections, while the fixed installation is suitable for continuous monitoring at secured checkpoints. Its contactless design ensures non-intrusive operation, making it particularly effective in environments such as corporate offices, correctional facilities, courtrooms, and government buildings, where the unauthorized movement or theft of sensitive paper documents is a critical concern. The system achieves real-time detection and alerting, thereby reducing the need for manual inspections and improving overall screening efficiency Refer Figure 1

(57) Abstract :  
ABSTRCT INTERNET THROUGH LIGHT: DATA TRANSMISSION SYSTEM USING MODULATED LIGHT Described herein a light-based wireless communication system and method that utilizes modulated visible light for data transmission. the system comprising: a source module configured to transfer data through a wired or wireless interface; a transmission module comprising a transmission processing module configured to convert the transferred data into an encoded data stream, said processing module configured to control a light-emitting module of the transmission module to generate modulated optical signals corresponding to said encoded data stream; a receiver module comprising a light-sensing module for detecting said modulated optical signals, and a signal processing module for converting the modulated optical signals into electrical signals; and a receiver processing module configured to demodulate the electrical signals and reconstruct the transferred data. (57) Abstract :

ABSTRACT RNA & MICRO-CLIMATIC CONDITION BASED YIELD & GROWTH PREDICTION OF CROPS USING IOT & REINFORCED MACHINE LEARNING Described herein the system and method for predicting crops yield and growth. The system comprises a plurality of sensors configured to collect real-time environmental data. The system comprises an image capturing device configured to capture plant growth images, and a machine learning module configured to analyze the collected real-time environmental data and plant images to make predictions about crop yield and growth. (57) Abstract :

ABSTRACT A SYSTEM AND METHOD FOR SIGN/GESTURE LANGUAGE TRANSLATION INTO TEXT USING CONVOLUTIONAL NEURAL NETWORKS Described herein an automatic system for converting a gesture content into a text content in real time for resolving the challenges. The system comprising one or more cameras for capturing the gesture content of a user in real time; a segmentation unit for eliminating noise and isolating gestures from the captured gesture content of the user to form a segmented gesture content; a feature extraction unit for extracting spatial features from the segmented gesture content of the user; a gesture recognition unit for recognizing the segmented gesture content on the basis of extracted spatial features; and an output unit for displaying the recognized segmented gesture content in the form of text content. Refer Figure 3

## (57) Abstract :

ABSTRACT A DESIGN AND DEVELOPMENT OF PORTABLE MANUAL CARRIER Described herein a portable carrier that assists in unloading and handling goods like vegetable boxes from trucks. The carrier comprising: a sliding table mechanism configured to be mounted on a truck bed; a detachable frame for supporting the sliding table mechanism; and a locking mechanism for holding the sliding table mechanism in both extended and retracted positions. (57) Abstract :

**ABSTRACT BAMBOO-COLD FORMED STEEL COMPOSITE STRUCTURAL SECTION** The present invention relates to a bamboo-cold formed steel composite structural section and a method of manufacturing the same comprising: a pair of cold-formed thin-walled steel channels, each having a web and flanges, configured to form a primary load-bearing structure; a plurality of bamboo plywood panels bonded to the web and flanges of the steel channels using a high-strength structural adhesive; and a series of mechanical fasteners reinforcing the adhesive bond, wherein the bamboo plywood panels, in combination with the cold-formed steel channels, contribute to enhanced axial and flexural load-bearing capacity, buckling resistance and shear transfer efficiency, forming a structurally integrated composite section. (57) Abstract :

**ABSTRACT** AIRFLOW ENERGY RECOVERY SYSTEM Accordingly, the present invention provides an energy recovery system for generating electricity using airflow from a cooler motor, comprising: a cooler motor configured to generate airflow during operation; an airflow harnessing mechanism configured to direct the airflow efficiently; an AC synchronous motor operatively coupled to the airflow harnessing mechanism to convert the kinetic energy of the airflow into electrical energy; and a power generation circuit connected to the AC synchronous motor for conditioning the generated electrical energy for household use. (57) Abstract :  
ABSTRACT TWO-WHEELER PATIENT SUPPORT KIT The present invention provides a two-wheeler patient support kit comprising: a half-body support structure configured to securely attach a conscious patient to a rider on a two-wheeler; a head support mechanism coupled to the support structure for stabilizing the patient’s head and neck; a lightweight frame constructed from polypropylene for cushion padding and Carbon Fiber Reinforced Plastic (CFRP) for structural support, with a tensile strength of 500–1000 MPa; a plurality of fasteners configured to attach the support structure to the motorbike and patient; and a shock absorption mechanism integrated into the support structure to minimize vibrations and external impact during transit. ## (57) Abstract :

ABSTRACT SYSTEM AND METHOD FOR MEASURING CAM SHAFT ANGLES IN THE TEXTILE INDUSTRY The present invention provides a system and method for measuring cam shaft angles in the textile industry, said system comprising: a cam shaft (1) used in textile machinery for manufacturing printed textiles and garments; an incremental or absolute magnetic encoder mounted on the cam shaft (1), wherein the encoder (2) measures the angle of the cam shaft based on its resolution; a microcontroller connected to the encoder (2), wherein said microcontroller processes the angle data obtained from the encoder; a bluetooth module connected to said microcontroller for transmitting the processed angle data; and a mobile application (4) configured to receive and display the transmitted angle data for analysis and adjustment of the cam shaft angle. (57) Abstract :  
ABSTRACT HYBRID CONCRETE COMPACTION APPARATUS AND A METHOD OF COMPACTING CONCRETE The present invention provides an hybrid concrete compaction apparatus and method comprising: a structural frame having a bottom frame, a top frame, and vertical columns extending therebetween; a platform mounted on the top frame, configured to support one or more concrete moulds, the platform comprising a meshed structure for weight reduction while maintaining structural integrity; a vertical dropping mechanism configured to lift and drop the platform under gravitational force to compact concrete within the moulds, wherein the drop height is calculated based on energy transfer specifications derived from IS 1199 Part 4 (2018) to ensure uniform compaction without segregation or bleeding; a motor assembly detachably mounted on the bottom frame and operatively connected to the vertical dropping mechanism via a belt drive system; a manual operation mechanism having a detachable handle connected to an axle for manual rotation when automatic operation is not feasible; and a swivel arrangement allowing the platform to split into two parts for transitioning between manual and automatic operation modes. (57) Abstract :

ABSTRACT PROCESS FOR PRODUCING A MICRO-FERTILIZER FROM BANANA PEELS AND STEM AND A MICR-FERTILIZER THEREOF The present invention provides a process for producing a micro-fertilizer from banana peels and stems and a micro-fertilizer, comprising the steps of: collecting and cleaning waste banana peels and stems to remove contaminants; shredding the cleaned material and drying it to remove moisture; grinding the dried material into a fine powder; mixing the powder with 1200–1400 mL of distilled water to form a slurry, and stirring at 300 rpm under heating at 70°C to 80°C; adding 0.5 N potassium hydroxide (KOH) to the slurry to extract potassium and phosphorus, and stirring until a viscous slurry is formed; cooling the slurry to room temperature; filtering the slurry to separate the liquid filtrate from solid sludge; adding a 10% coffee powder extract, prepared by heating 10 g of coffee powder in 100 mL of water at 100°C for 1 hour, to enrich the filtrate with nitrogen; adjusting the pH of the filtrate to 5.0–5.3 using lemon juice (95%–98% purity); obtaining a liquid micro-fertilizer with a particle size of 1–1000 µm and a zeta potential of approximately -5.42 mV. ## (57) Abstract :

A vehicle-mounted autonomous navigation system (100) and method are disclosed for real-time path following using an LED-guided track. The system (100) comprises at least one colour sensor mounted beneath the vehicle chassis to detect colour variations in the path. A multiplexer unit (102), communicatively coupled to the colour sensor, processes the detected colour data and transmits it to a microcontroller unit (103). The microcontroller unit (103) analyses the colour data to determine navigation commands and sends corresponding control signals to a motor control unit (104). The motor control unit (104) then adjusts the vehicle's movement, enabling autonomous navigation along the LED-guided path. This system (100) provides an efficient and adaptive solution for autonomous vehicle guidance in controlled environments. (to be published with figure 1)

(57) Abstract :  
DESIGNING AND AI POWERED RECOMMENDATION SYSTEM FOR E-COMMERCE PLATFORMS The present invention discloses to a recommendation engine driven by AI designed specifically for e-commerce platforms to improve user experience and increase sales. In order to provide real-time personalized product recommendations, the system examines user behaviour, preferences, and transaction history using machine learning methods, such as collaborative filtering, content-based filtering, and hybrid models. The suggested architecture combines deep learning for dynamic adaptation to changing user interests with natural language processing (NLP) for customer review analysis. The system's scalability and effective handling of massive amounts of data are important features that make it appropriate for expanding online retail settings. When compared to conventional recommendation methods, experimental results show notable gains in user engagement, click-through rates, and conversion metrics. Through automation and data-driven decision-making, this research aids in the creation of intelligent e-commerce platforms that support strategic company objectives while simultaneously optimizing customer pleasure.

(57) Abstract :  
ABSTRACT SYSTEM AND METHOD FOR REAL-TIME VIDEO STREAMING INFORMATION RELATING TO TRANSPORTATION Disclosed is a system (100)and method(200) for real-time video streaming information relating to transportation that comprises a user device(127) that allows users to access live updates. Users input queries, specifying a preferred location and language, through typed-text or voice-commands, with the system automatically detecting the language via a multi-lingual module(106). The data acquisition module(101) retrieves raw transportation data, including schedules, delays, and hub assignments, from service provider servers, storing it in a real-time database(102). The data processing module(104), aided by the multi-lingual module (106), processes and translates the data into the user’s preferred language. The content generation module(108) produces visual schedules, 3D overlays, and voiceovers, which the screen capturing module(114) transforms into low-latency streams. The multi-platform streaming module(122) broadcasts these streams to digital platforms in a news-feed format, delivering culturally relevant, real-time updates within a 6-hour window, displayed on the user device(127) for seamless access across various platforms.

ment of cancer, and composition thereof Disclosed herein is a compound of Formula 1, or a salt thereof, which is a compound of Formula 1, or a salt thereof, as a compound of Formula 1, or a salt thereof, according to embodiments herein is an inhibitor of PI3K alpha isoform. In some embodiments, the disclosed compound offers a more targeted, effective, and potentially less costly treatment for management, or both, of cancer. Embodiments herein further disclose a method of treating cancer by administering the disclosed compound. In some embodiments, the disclosed compound has been found to be a specific inhibitor of PI3K $\alpha$ . In some embodiments, the disclosed compound offers a more targeted, effective, and potentially less costly

(57) Abstract :

ABSTRACT A method for preparing an eco-friendly composite, and composite thereof Embodiments herein disclose a method for preparing an eco-friendly composite. The method, according to embodiments herein include combining Saccharum Munja fibers and HDPE. The method, according to embodiments herein address common challenges in 3D printing high-density polyethylene (HDPE), including shrinkage, warping, and void formation. The composite prepared using the disclosed method is lightweight, durable, recyclable, and cost-effective, while also exhibiting superior mechanical properties. FIG. 1

(57) Abstract :  
The present invention relates to dental health assessment and monitoring device. The system comprises a processing unit (101), a power supply module (102), a color sensor module (103) for detecting tooth surface color variations, an LED light source (104) for enhanced accuracy, and a database (105) for reference data storage. The device features user controls (106), a display interface (108), and a wireless connectivity module (109) for real-time analysis via Bluetooth, Wi-Fi, or cloud integration. The system provides AI-assisted diagnostics, enabling predictive analysis and tele-dentistry support. The power-efficient design includes a rechargeable battery (102a) and USB charging interface (102b). The automatic calibration system (110) ensures accurate readings under various lighting conditions. The Tooth Quality Analyzer (100) offers real-time monitoring, user-friendly operation, and professional integration, enhancing dental care efficiency and accessibility.

(57) Abstract :

A hydrogel for diabetic wound healing, method of preparation and application thereof. A hydrogel for diabetic wound healing, method of preparation and application thereof is disclosed herein. In one embodiment, the hydrogel is a peptide of SEQ ID NO. 1, wherein the peptide is chemically modified by capping the N-terminus with a fluorenylmethyloxycarbonyl (Fmoc) group. The disclosed hydrogel demonstrates remarkable versatility, promoting cell proliferation and migration while possessing antioxidant, anti-inflammatory, and angiogenic properties. Further, the disclosed hydrogel is highly cytocompatible, hemocompatible, and biodegradable, ensuring its suitability for a wide range of applications. Moreover, the hydrogel is highly efficient, capable of healing diabetic wounds on its own without the need for additional cells, cytokines, or drugs, setting it apart from other diabetic wound healing scaffolds. Embodiments disclosed herein further provide an inexpensive and cost-effective method for preparing the disclosed hydrogel. FIG. 1A

(57) Abstract :  
MACHINE LEARNING-BASED FORECASTING OF CROP YIELD USING CLIMATE AND REMOTE SENSING DATA The present invention relates to food security and agricultural practice optimization, accurate crop production forecasting is essential. This work integrates climate variables and remote 5 sensing data to anticipate agricultural yield using a machine learning-based method. The model uses soil properties, satellite-derived vegetation indices, and historical weather trends to identify intricate, non-linear interactions affecting crop productivity. To find the best prediction framework, a number of machine learning methods were tested, such as Random Forest, Support Vector Regression, and Gradient Boosting. The resilience and adaptability of 10 the suggested method are highlighted by its high predicted accuracy across a variety of crop varieties and geographic locations. Furthermore, the model provides real-time yield estimation capabilities, allowing supply chain stakeholders, farmers, and regulators to make timely decisions. Forecasting reliability is greatly increased by integrating data from multiple sources, opening the door to more intelligent, data-driven agriculture in the face of resource 15 limitations and climate variability. ## (57) Abstract :

The invention relates to a handheld gardening tool (100) comprising a hook-shaped blade (105a) having a first notch (110a) at its lower end, a flat blade (105b) having a second notch (110b) at its lower end, one or more connecting screws (115), a first head portion (120a) attached to a first arm (125a), a second head portion (120b) attached to a second arm (125b), a first straight pipe (130a) including a first angular gripping portion (135a), a second straight pipe (130b) including a second angular gripping portion (135b), a first handle (140a) including a first lateral gripping portion (145a) at one end, a second handle (140b) including a second lateral gripping portion (145b) at one end, a first c-shaped handle (150a) including a first c-shaped gripping portion (155a) and a first lower diagonal gripping portion (160a), a second c-shaped handle (150b) including a second c-shaped gripping portion (155b) and a second lower diagonal gripping portion (160b) and a stopper (165). (57) Abstract :

The present invention relates to a process for preparing a ready to fry gluten free pellet product composition. Corn flour (50 % w/w), rice (10 % to 40 % w/w) and quinoa (10 % to 40 % w/w) are milled and sieved to obtain a consistent flour mixture. Water (20 % w/w) and xanthan gum (0.2 % w/w) are added to the flour mixture to form a dough. The dough is kept at rest for 20 to 25 minutes, the dough is kneaded and a sheet of the dough of 1 mm thickness is formed. Two layers of sheets of 2 mm thickness are placed onto one another and cut using a mould or a die-cutter to form pellets. The pellets are dried at a temperature of 60 °C to 80 °C in a cabinet dryer till moisture content of the pellets reaches to 4 %. Fig. 1

(57) Abstract :

ABSTRACT STABILIZING FLUORINE-BASED POTASSIUM POLYANION CATHODE VIA 'ELECTROCHEMICAL ACTIVATION METHOD'. The present invention pertains to electrochemical activation method for enhancing the properties of tavorite-type fluorine-based potassium polyanionic cathode and usage of the same as high performance cathode material for potassium-ion batteries.

(57) Abstract :  
A cooling system for a biaxial material testing apparatus and a method of cooling thereof. The disclosure herein relates to a cooling system (100) for a biaxial material testing apparatus and a method (300) of cooling the biaxial material testing apparatus. The cooling system (100) includes a plurality of cooling members (102) and a control module (104). The plurality of cooling members is secured to a sample (10) and is configured to circulate a coolant for cooling the sample. The control module is provided in communication with the plurality of cooling members and is configured to regulate the temperature of the sample within a predetermined range by controlling the flow of the coolant to each cooling member. The cooling system enables biaxial testing of the cruciform sample at low temperatures. The cooling system can be operated at low cost and can be fabricated at low cost. FIG. 1A

(57) Abstract :  
ABSTRACT AUTOMATED HAND DRYING SYSTEM WITH HIGH-EFFICIENCY PARTICULATE AIR (HEPA) FILTRATION AND INTELLIGENT FAN CONTROL The present invention discloses an automated hand drying system (100) designed to reduce microbial contamination by delivering HEPA-filtered air. The system comprises a housing (102) with air inlets (104) and an air outlet (106), at least one High-Efficiency Particulate Air (HEPA) filter sheet (108) proximate to the inlets for removing airborne particulates, and one or more axial cooling fans (110) for drawing and directing filtered air. An ultrasonic sensor (112) detects hand proximity and triggers a microcontroller-based control unit (114), which processes detection signals and activates a relay module (116) to switch the fans on or off. The system further includes a regulated power supply (118) and a feedback module (120) for operational indication. Optional features include timer-based override, noise suppression, and environmental sensing to adjust performance. This invention ensures hygienic, touchless hand drying with significantly reduced bacterial transmission, suitable for critical environments like healthcare, food processing, and cleanrooms. FIG. 1 will be the reference figure.

(57) Abstract :  
ABSTRACT POSTURE DETECTION SYSTEM AND A METHOD THEREOF A posture detection system (100) includes a set of sensors (102a-102n) designed to capture motion data corresponding to a user's body movements. These sensors (102a-102n) are connected to a processor (104), which processes the motion data to analyse the user's posture. The processor (104) determines the spatial relationship between joints using a Graph Convolution technique and assesses variations in joint movement over a defined time interval using a Temporal Convolution technique. Based on these analyses, the processor (104) identifies deviations from correct posture by evaluating both joint relationships and movement changes. When an incorrect posture is detected, the processor (104) triggers the generation of an alert signal to notify the user. This enables real-time posture monitoring and correction, helping to prevent discomfort or musculoskeletal issues. The integration of Graph and Temporal Convolution techniques allows for accurate and dynamic posture assessment, making the system (100) suitable for ergonomic and health-related applications. FIG. 1 is the reference figure.

## (57) Abstract :

ABSTRACT AUTOMATED CONCRETE WEIGHT MONITORING SYSTEM AND METHOD FOR RMC TRANSIT MIXER The present invention relates to an automated method and system (100) for monitoring the weight of concrete in a ready-mix concrete (RMC) transit mixer (106). The system employs a plurality of ultrasonic distance sensors (102-1, 102-2, 102-3) strategically positioned on the drum (104)—at the left-hand side, right-hand side, and rear side—to measure the distance between the drum base and a level surface. A microcontroller (108) receives and processes these measurements, while a memory unit (110) stores baseline (empty) and loaded data. A processing unit (112) calculates the concrete weight by comparing real-time and stored data. An inertial measurement unit (IMU) (114) compensates for tilt variations, while a GPS module (116) geotags the data. A logging unit (118) records the weight periodically, and a wireless module transmits data remotely. This system provides an accurate, real-time, and automated solution to overcome manual estimation errors in RMC operations, enhancing operational efficiency and traceability. FIG. 1 will be the reference figure.

(57) Abstract :  
DISTRIBUTED SYSTEM FOR AUTOMATED CLASSIFICATION OF LUNG DISEASES USING RESPIRATORY ACOUSTIC SIGNALS The present invention discloses a distributed system (100) and method for automated classification of lung diseases using respiratory acoustic signals. The system comprises an edge device (200) configured to acquire lung sound data via a digital stethoscope or embedded microphone, and perform local pre-processing including normalization and data augmentation using a conditional Generative Adversarial Network (cGAN). Acoustic features are extracted using Mel Frequency Cepstral Coefficients (MFCC), Mel spectrogram, or Short-Term Fourier Transform (STFT). A device-specific inference acceleration module (300) equipped with a hardware accelerator executes a hybrid model combining Convolutional Neural Networks (CNN) with Bidirectional Long Short-Term Memory (BiLSTM) or Bidirectional Gated Recurrent Unit (BiGRU) to classify the features into disease categories including COPD, pneumonia, bronchitis, URTI, asthma, or healthy status. Anonymized classification results are transmitted (210) to external devices (500) for real-time display and optional structured diagnostic report generation, facilitating portable and intelligent respiratory diagnostics. FIG. 1 will be the reference figure.

(57) Abstract :

ABSTRACT A SYSTEM FOR BREAST CANCER DETECTION USING PORTABLE IMAGE ACQUISITION AND DEEP LEARNING METHODS Disclosed is a disease detection system (100) that includes a plurality of imaging units (102a-102n), a pre-processing unit (104), and a processor (106). The plurality of imaging units (102a-102n) are configured to capture a plurality of images of breast of a plurality of patients. The pre-processing unit (104) is configured to receive the plurality of images and generate enhanced plurality of images. The processor (106) is configured to analyse the enhanced plurality of images. The processor (106) is further configured to classify the enhanced plurality of images as cancerous images or non-cancerous images. The enhanced plurality of images are classified by way of a Deep Convolutional Neural Network (CNN) classifier. FIG. 1 is the reference figure.

(57) Abstract :  
ABSTRACT SHELL-ENCLOSED SPIRAL HEAT EXCHANGER The present invention provides a shell-enclosed spiral heat exchanger comprising: a continuous spiral tube arranged in a helical configuration to maximize heat transfer surface area; an outer shell fully enclosing the spiral tube, the shell providing structural reinforcement and protection from external contaminants; and a pair of fluid communication ports formed in the shell, comprising an inlet and an outlet, configured to introduce and remove fluid from the heat exchanger. (57) Abstract :

Modular Test Rig for Evaluating Triboelectric Nanogenerator Performance Across Diverse Operating Modes This invention describes a multi-mode universal testing apparatus for Triboelectric Nanogenerators (TENGs), capable of evaluating all four operational modes—Vertical Contact-Separation (VCS), Lateral Sliding (LS), Single-Electrode (SE), and Free-Standing (FS). The apparatus incorporates a motor-driven slider-crank mechanism with an adjustable crank radius for controlled reciprocating motion. An “L”-shaped bracket transmits this motion to modular electrode assemblies, enabling precise vertical and horizontal actuation. Interchangeable dielectric material carriers allow flexible configuration for diverse triboelectric materials. A Digital Storage Oscilloscope (DSO) measures real-time voltage output and calculates charge generation using an internal equivalent circuit. The system supports parametric testing of displacement, contact force, frequency, and environmental conditions. This compact, cost-effective platform addresses the limitations of existing single-mode test setups and is intended for academic, industrial, and research applications in energy harvesting and self-powered electronics.

(57) Abstract :

The present invention introduces the innovative approach, particularly the integration of CLU technology with pyrolysis, represents a significant advancement over existing systems. The method efficiently converts non-recyclable plastic waste into valuable fuels and chemicals while minimizing environmental impact. By leveraging the CLU unit, the pyrolysis process enhances the quality of hydrocarbon products, promoting resource recovery and supporting the circular economy. This innovative approach not only addresses the growing plastic waste crisis but also contributes to energy sustainability and carbon footprint reduction. Ultimately, the integration of pyrolysis and CLU technology presents a viable pathway for transforming waste into valuable resources. Addressing previous limitations, this process aligns with both economic and environmental goals, making it highly patentable. FIG.1

(57) Abstract :

The present invention discloses a system and method for adaptive optimization of artificial intelligence (AI) models using context-aware learning to enhance decision-making across dynamic environments. The system integrates real-time contextual data, feedback from end-users or external agents, and adaptive learning mechanisms to update and refine AI models with minimal latency. This approach improves model relevance, reduces false predictions, and ensures sustained accuracy across varying conditions and user behaviors. The invention is applicable to domains including healthcare, finance, autonomous systems, and intelligent assistants. FIG.1

(57) Abstract :

A process for the single-step fabrication of microfibers homogeneously coated with nanomaterial, said process comprising the steps of : (i) providing an inner phase solution comprising of a homogenous polymeric solution, obtained by dissolving a polymer into an appropriate solvent; (ii) providing an outer phase solution comprising of a nanomaterial dispersion, obtained by ultrasonically dispersing nanomaterial into an appropriate liquid; (iii) injecting the outer phase nanomaterial dispersion into a co-axially placed outer glass capillary, and simultaneously injecting the polymeric inner phase liquid into the inner fitted glass capillary of a glass microfluidic device, said polymeric solution forming a jet in presence of the outer flowing nanomaterial dispersion which solidifies into a solid fiber coated with nanomaterial based on the principle of solvent removal; (iv) collecting the solid nanomaterial coated fibers, followed by drying in a hot air oven. Also provided is a device for fabricating microfibers homogeneously coated with nanomaterial.

(57) Abstract :

Present invention claims the method for deposition of molybdenum oxide/reduced graphene oxide composite thin coating on conducting [stainless steel (SS) substrates]. The thin coating was deposited chemically by varying concentrations of sodium molybdate precursors (0.025 to 0.1 M) at different temperatures (333 to 353 K) for various deposition times (2-4 h). The 5 ml reduced graphene oxide (rGO) slurry of density 1 mg/mL was added in sodium molybdate solution. The XRD pattern and SEM images of molybdenum oxide/reduced graphene oxide composite coating shows hexagonal crystal structure with substrate surface covered with nanoparticles like morphology. Molybdenum oxide/reduced graphene oxide composite thin coating showed energy storage property in aqueous 1 M H<sub>2</sub>SO<sub>4</sub> electrolyte with specific capacitance of 728.6 F g<sup>-1</sup> at a scan rate of 5 mV s<sup>-1</sup>.

(57) Abstract :  
The present invention relates to an integrated strategy that combines targeted nanoparticles with cutting-edge machine learning algorithms. Medical imaging data was used to train machine learning models, such as support vector machines and deep neural networks, to accurately detect cancerous patterns. At the same time, functionalized nanoparticles were created with the ability to attach to cancer cells specifically, improving contrast in imaging tests like CT and MRI scans. By lowering false positives and facilitating early action, the combination of the high specificity of nanoparticle targeting and the intelligent analytical power of machine learning greatly enhanced diagnostic results. The promise of this hybrid system was validated by experimental results that showed higher detection rates when compared to traditional approaches. This strategy has the potential to revolutionize breast cancer diagnosis by providing a potent instrument for non-invasive, individualized cancer screening. FIG.1

(57) Abstract :  
In the present invention, a tailored Electrospun hydrophilic-hydrophobic composite membrane is provided comprising a hydrophobic polymer selected from polyvinylidene fluoride (PVDF), Polytetrafluoroethylene (PTFE), and Polyethylene (PE) and a hydrophilic polymer selected from polysulfone (PSf), Polyethersulfone (PES), and Polyvinyl alcohol (PVA). This membrane is fabricated in a manner wherein the bottom layer is hydrophobic and the hydrophilicity keeps on increasing towards the top with gradual decreasing amounts of the hydrophobic and proportionate increase of the hydrophilic polymers in between. The composite membrane has smooth surface and improved membrane water flux properties due to hierarchial structure of the membrane. These tailored multi-layered composite membrane is prepared by process of electrospinning using hydrophobic and hydrophilic polymers in different ratios during electrospinning. This tailored hydrophilic hydrophobic composite membranes has improved fiber structure and morphology with finer fibers and no beads-on-string structure and improved membrane distillation properties for water purification. Also provided is a method of preparation of such membrane.

Figure 1: Images of the Electrospun membranes a) P\_ENM and b) TPP\_ENM and SEM images of the membranes: c) and e) P\_ENM (low and high resolution respectively, and d) and f) TPP\_ENM (low and high resolution respectively)

(57) Abstract :  
ABSTRACT SYSTEM AND METHOD FOR PURIFICATION OF AIR AND EXTRACTION OF PARTICULATE-MATTER THEREFROM The present disclosure provides a method (1100) for switching between an air purification mode or a solid particulate-matter extraction mode via a control system (910). The control system (910) is connected to at least one electrode assembly (112), a first pump (122), and a second pump (904) for regulating operation thereof. The air purification mode corresponds to a process (1110) for removing particulate-matter from a stream of air and the solid particulate-matter extraction mode corresponds to a process (1120) for removing solid particulate-matter from the at least one of the cell assembly (104), the at least one electrode assembly (112), and the hopper assembly (106). (to be published with figure 11A)

(57) Abstract :  
The present disclosure pertains to a system (100) and method (200) for interactive learning in a virtual campus environment. The system (100) may include processors (110) and a memory (112). The processors (110) receive data associated with user profiles from user devices (106), generate avatars corresponding to each of the user profiles, render the virtual campus environment on the user devices (106) using a virtual campus generation module (126), where each of the avatars interact within the virtual campus environment to engage in academic activities. Further, the processors (110) asynchronously track avatar interactions occurring in the virtual campus environment and user interactions occurring in a physical environment, where the asynchronously tracked avatar interactions and the user interactions are stored in a server (108), generate academic recommendations for interactive learning, using an Artificial Intelligence (AI) model to provide personalized academic feedback.

## (57) Abstract :

ABSTRACT U-SHAPED OPTICAL FIBER SENSOR PROBE AND CARTRIDGE THEREFOR FOR DETECTING TEST ANALYTE Embodiments herein disclose a  $\mu$ -sens fiber optical sensor device (200) comprising a cartridge unit (224) designed for housing a U-shaped optical fiber sensor probe (222). The cartridge unit (224) is at least one of a static type configuration and a flow type configuration. An opto-electronic interface of the  $\mu$ Sens device houses a LED with a regulated power supply which illuminates the optical fiber sensor probe and a photo detector unit. Light output from the optical fiber (222) is converted to digital which is analyzed by a microcontroller and analysis result is displayed on a graphical user interface as a calibrated quantitative parameters or as qualitative notification, indicating the presence or absence of a target molecule in a tests analyte. (57) Abstract :

The medicated wipes for treatment of fever, inflammation and providing soothing effect is provided herein. The medicated wipes comprise Sodium Chloride (NaCl), Glycerine, Menthyl succinate, Aloe Vera (Aloe barbadensis), Neem (Azadirachta indica) Extract, and Ginger (Zingiber officinale) extract and one or more pharmaceutically acceptable excipients. The process for preparation of medicated wipes is also provided herein

(57) Abstract :

The present invention provides a cobalt-free O<sub>2</sub>-structured 'layered' lithium transition metal (TM) oxide cathode material, having a composition of Li<sub>0.74</sub>Ni<sub>0.22</sub>Mn<sub>0.66</sub>Mg<sub>0.02</sub>O<sub>2</sub>, which is synthesized via spontaneous chemical ion-exchange. In this process, Na<sup>+</sup> ions from a high Na-containing P2-structured Na-TM-oxide (Na<sub>0.84</sub>Ni<sub>0.22</sub>Li<sub>0.04</sub>Mn<sub>0.66</sub>Mg<sub>0.02</sub>O<sub>2</sub>) are replaced by Li<sup>+</sup> ions, as supplied by a Li-containing electrolyte, resulting in the formation of the desired O<sub>2</sub>-structured Li-TM-oxide cathode material. This composition is achieved without any externally applied potential, and bestows high structural stability, excellent electrochemical reversibility, and enhanced capacity retention upon being subjected to multiple charge/discharge cycles, while eliminating the reliance on cobalt and mitigating issues associated with transition metal migration to the Li-layer (i.e., 'cation mixing').

## (57) Abstract :

Sensing human emotions is a paramount subject in areas ranging from human computer interaction (HCI), mental health care, education, and even marketing. An automated and objective, and possibly real-time approach to emotion recognition brings forth the "IoT based System for Detecting Human Emotions Through Deep Neural Network Models" this invention focuses on. Unlike traditional methods which focus on using expert observation or self-reports, this approach employs real-time emotion detection through a multi-modal neurophysiologic interrogation powered by artificial intelligence. The primary approach revolves around monitoring numerous sources of data to give a complete representation of the user's affective state. Physiological data is gathered using wearable sensors, including an electroencephalogram (EEG) headset which captures brain electrical activity patterns involved in cognitive and emotional processes, as well as a wrist heart rate sensor with blood vessel contractions correlating to arousal levels. A machine vision component using a camera equipped with recognition algorithms also monitors facial expression, potent indicators of emotion. With the use of Bluetooth, heterogeneous data streams will be collected and aggregated by a microcontroller unit along with initial feature extraction synchronized through local processing. Using principles from the IoT, the data collected is sent through a network infrastructure to a remote server. The wireless transfer utilizes standard protocols like Wi-Fi. The server contains the core intelligent of the system and contains an ensemble Deep Neural Network (DNN). The DNN undergoes training with vast datasets which incorporates EEG, heart rate, and facial expression data, enabling deep understanding and identification of correlations and patterns within the data. With these multimodal inputs, the DNN adeptly classifies what the user's emotion is (happy, sad, angered, surprised,neutral). This constitutes a single integrated system which incorporates assessment and monitoring on a single non-invasive framework and further enhances the accuracy both enable through higher precision contributed with multiple data gather sensor modalities. From having an assessment and therapy tool for mental health, adaptive interfaces that gauge user satisfaction in real time, foresightedness in driver safety applications through monitoring alertness and stress, as well as gaining deeper insights into consumer behavior, integrate vast potential application Monito. The utility of this IoT-DNN framework marks a significant advancement towards fully effortless and objective understanding of a user's automated emotion in various real-world settings.

(57) Abstract :  
ABSTRACT AN AUTOMATIC GYM POSITION TRACKING SYSTEM Described herein a method for providing feedback on the gesture of a user while performing a pre-defined activity in real time. The method comprising: observing the movement of a user by one or more cameras; detecting the pre-defined activity of the user in real time on the basis of the observed movement by the one or more cameras; fetching one or more body landmarks of the user according to the detected activity by a controller; capturing one or more positions of the user in real time while performing a pre-defined activity by the one or more cameras; preparing a complete posture for each position by connecting all the landmarks for the pre-defined activity; and providing visual feedback to the user to correct the posture of the user for the pre-defined activity in real time. (57) Abstract :

The growing requirement for real-time comprehension of human emotional states in a range of areas including human-computer interaction, market research, healthcare maintenance and driver safety imposes efficient and user-friendly analytics tools. Conventional methods frequently rely on cloud-based processing, which may suffer from latency and become bandwidth consuming (especially considering streaming sensors). Widespread concerns of data privacy would be another issue when heavy sensitive biometric information (such as facial image) is inferred. To address these limitations, this paper introduces a Portable Edge Intelligence Camera Unit, designed for automatic in-device emotion detection and sentiment analysis. This portable stand alone system combines critical hardware and software in a compact stand alone package. At the core of its functionality, there is a built-in camera that takes pictures of faces or videos. This visual information is processed by an inner edge computing device that resides inside a base enclosure. It features a powerful Convolutional Neural Network (CNN) pre-trained on facial expression recognition and is capable of classifying emotions such as happiness, sadness, anger, and neutrality. The enclosure houses the required memory and storage for the OS, app, and AI model as well. User is shown the results in real-time on the integrated screen with the live camera feed, highlighted detected faces and categorized emotion classification, giving user instant feedback in terms of sentiments. Condition indicator LED light can tell you the working condition of the device. A USB data port allows you to connect the logger to the data logger for data logging or model updates and it is powered via a dedicated power input for use as a standalone model. With all computation being executed on-device (edge intelligence) the system drastically reduces latency and limits bandwidth needs, while turning user's privacy, since there's no longer a necessity to send out sensitive image data outside the unit for analysis. This mobile camera unit provides a practical, efficient and privacy aware means to deploy advanced emotion detection abilities in real world, real time settings that require timely local sentiment analysis.

(57) Abstract :

ABSTRACT IRIS RECOGNITION SYSTEM WITH INTEGRATED BLACK WIDOW OPTIMIZATION AND CONVOLUTIONAL NEURAL NETWORK (CNN)

An iris recognition system comprises a camera (102) capturing an eye image, an image processor receiving the captured image, and a memory storing iris recognition software and templates. The system includes a preprocessing module (108) isolating and normalizing an iris region using a Hough Transform, a feature extraction module (110) implementing a ScaT-LOOP process integrating scattering transforms, tetralet transforms, and Local Optimal Oriented Pattern descriptors, and a classification module (112) using a Black Widow-optimized Convolutional Neural Network (BW-CNN) framework. A display device outputs recognition results, while a communication interface transmits results to external systems. The BW-CNN framework comprises multiple convolutional layers optimized by a Black Widow Optimization algorithm. The ScaT-LOOP process generates and combines multiple descriptor outputs to produce a final feature representation. The system implements an end-to-end optimization approach, jointly optimizing preprocessing, feature extraction, and classification stages to improve recognition performance across diverse image capture conditions. (57) Abstract :  
A temporary housing assembly (100) for multi-functional spaces is disclosed. A footing assembly including a plurality of pre-cast footings (105) to provide a stable foundation. A plurality of structural chassis provides a structural framework and forming a reconfigurable, extendable, habitable, dismantlable, and transportable housing structure, adaptable for a plurality of configurations and relocations. A flooring assembly including a plurality of floor beams (130) and a plurality of floorboard panels (135). A wall assembly includes a plurality of wall, a plurality of window cassettes (150) and a plurality of door cassettes (155). A supplementary accessories assembly a plurality of shading panels (140) and a demountable step assembly. A roofing assembly includes a plurality of mosquito nets (160), a plurality of supporting roofing frames (165), and a rainwater gutter (170). A corrugated fiber cement sheet (175) provides durability and weather resistance. FIG. 1(a) and FIG. 1(b)

## (57) Abstract :

The present invention relates to the creation of a self-cleaning solar panel technology that uses biodegradable nanocoatings to improve environmental sustainability and energy efficiency. Particularly in arid and dirty areas, dust and particulate deposition on solar panels drastically lowers their energy output. To solve this, we created a biodegradable nanocoating made of environmentally benign polymers and water-and dust-repelling hydrophobic nanoparticles. Standard solar panels were coated, and tests were conducted in real-world settings. The coated panels maintain up to 95% efficiency over time, while their uncoated counterparts see a 20–30% decline. The results show a significant improvement in transmittance and power production. The nanocoating's biodegradable nature guarantees a low ecological impact, supporting green energy objectives. This invention provides an affordable, environmentally friendly way to preserve solar panel efficiency, lessen the need for water and manual cleaning, and encourage solar energy systems to last longer. (57) Abstract :

The present invention relates to a method for stabilizing and reinforcing soil slopes. This method involves mixing weak clayey soil with industrial fly ash, a thermal waste byproduct, to improve the soil's shear strength and bearing capacity. The stabilized soil is then reinforced with geogrid layers placed at predefined vertical intervals within the soil mass to prevent tension failure and enhance slope stability. The process allows for the construction of steep slopes, reducing land acquisition requirements and ensuring sustainable use of industrial waste. The invention is particularly suited for heavy load-bearing structures such as roadways, embankments, and transmission tower foundations. Performance is verified through laboratory testing and model plate load tests, demonstrating improved soil strength, reduced failure potential, and enhanced load-bearing capacity. The method is cost-effective, environmentally friendly, and provides a reliable solution for stabilizing weak soil slopes in civil engineering applications.

(57) Abstract :

ABSTRACT OF THE INVENTION PC16 is a novel and unique multi-octave music system spanning from 1 Hz to 64536 Hz, consisting of 209 main frequencies distributed across 13 octaves. Each octave contains 16 equidistant notes in Hz, ensuring a linear frequency step, doubling in range with each octave. The system supports optional microtones for greater resolution, is primarily implemented in software with real-time synthesis and composer functionality, and optionally in hardware with flexible layout and transpose features. Applications include: • Music creation • Integration with Indian Classical Music (ICM) & Western Music. • Emotion-based therapy and healing • Meditation and brainwave alignment • Scientific and frequency-based research • Education in electronics and embedded design • Sensor stimulation and response mapping • Cosmic signal analysis and universe exploration • Generation of sound beyond human audible range (above 20,000 Hz), suitable for experimentation with non-human species like dogs, bats, or dolphins etc. This system is based on a binary progression, making it ideal for engineers and sound designers aiming to explore frequency logic in both audible and inaudible domains.

(57) Abstract :

ABSTRACT WEARABLE HEALTH MONITORING SYSTEM AND METHOD FOR MONITORING HEALTH OF USER A wearable health monitoring system (100) is provided for real-time detection of health anomalies in a user. The system (100) includes a plurality of sensors (102a–102n) configured to capture various health-related signals, such as physiological and motion data. These sensors (102a–102n) are connected to a processor (104), which receives the input signals and performs analysis to evaluate the user's health status. The processor (104) is designed to identify abnormal activities, such as irregular heart rhythms or sudden movements indicative of a fall, based on the analysed data. Upon detection of such abnormalities, the processor (104) generates an alert signal. An alert unit (106), operatively coupled to the processor (104), responds to this alert signal by issuing a notification. The alert unit (106) may deliver the notification through communication channels such as SMS or mobile applications, thereby enabling timely intervention from caregivers or medical personnel. FIG. 1 is the reference figure.

(57) Abstract :

The present invention relates to a non-isolated high-gain DC-DC converter topology that achieves significant voltage step-up without the use of coupled inductors. The converter comprises an electrical source (101), input inductor (102), and primary switch (103) to initiate energy storage. Energy is transferred via auxiliary inductor (104), first capacitor (105), and secondary switch (106). Diodes (107, 111, 112) ensure unidirectional current flow, while intermediate inductor (108) and second capacitor (109) support staged energy transfer. Tertiary switch (110) regulates the final transfer phase. An output capacitor (113) filters the boosted voltage delivered to load resistor (114). The topology enables high voltage gain with moderate duty cycles, mitigating switching stress and improving efficiency (>90%). A common ground configuration enhances control simplicity and EMI reduction. Simulation and hardware validation confirm stable voltage regulation, high power density, and reduced component stress. This converter is ideal for renewable energy, electric vehicles, aerospace, and industrial automation applications requiring efficient high-voltage DC output.

(57) Abstract :  
Disclosed herein is a system and method for controlling decentralized drone swarm with minimal dependency on ground control station. The system comprises a microcontroller (100) integrated with a RTK GNSS (Real-Time Kinematic Global Navigation Satellite System) module (200) and a digital compass (300) mounted swarming drones in communication with a ground station device (500). The microcontroller (100) is configured to: obtain full state vector values of the drone inbuilt sensors (402); apply a Kalman filter based prediction-correction loop on the obtained vector values to correct inherent sensor errors; compute centimetre-level positioning of each drone with respect to its neighbouring drones based on positioning signals received from the GNSS and positioning correction data received from the ground station device (500); calculate field of view of the drones and an overlapping factor between each drone and its neighbouring drones based on the corresponding field of view values; combining all data associated with the corrected full state vector, the centimetre-level positioning, the overlapping factor, and the digital compass output into a standardized data packet; exchange the data packet among the neighbouring drones through a low power wide area network protocol at a periodic time interval; and feed the exchanged data to a flight controller (404) of the corresponding drone (400) to adjust or set its positioning with velocity and orientation with respect to the neighbouring drones to reach its target waypoint. (57) Abstract :  
A system (100) and a method (900) for unified interconnection and intelligent coordination of Internet of Things (IoT) devices (102AA–102NN) across multiple device groups (102-A-102-N) is disclosed. The system (100) includes a processor (202) and a memory (204) configured to receive telemetry data from the IoT devices (102AA–102NN), register the devices with secure identities and metadata using a device registry manager (208D), and instantiate corresponding digital twins via a digital twin manager (208A). A rule evaluation engine (208B) determines coordination logic based on orchestration rules and telemetry data. The system (100) maintains synchronization between digital twins and IoT devices, and updates digital twins when devices are offline using a device shadow (704) stored in a cloud (108). The system (100) further includes an artificial intelligence module (604) for anomaly detection (604-A), predictive maintenance (604-B), and optimization (604-C), and may route telemetry data through a message broker (112).

(57) Abstract :

The present invention discloses a Smart Helmet system designed to enhance user safety by integrating multiple sensing and control technologies. The helmet incorporates a fingerprint-based biometric sensor for user authentication, an infrared (IR) sensor to confirm helmet usage, an MQ3 alcohol sensor to detect ethanol presence in breath, an ADXL345 accelerometer for accident or fall detection, and a GPS module for real-time location tracking. An ESP32 microcontroller coordinates all components, controlling ignition access, monitoring user behaviour, and triggering emergency alerts when necessary. The system prevents ignition if the helmet is not worn correctly, the rider is intoxicated, or unauthorized access, is detected. In the event of an accident, the system transmits the location to emergency contacts automatically. This integrated, modular safety solution is especially beneficial for two-wheeler users and industrial workers, promoting safer and more responsible behaviour on roads and in hazardous environments. ## (57) Abstract :

Disclosed herein is a method for preparing anatase-bronze mixed-phase Titanium Dioxide (TiO<sub>2</sub>) nanomaterial for applications in photocatalysis, electrochemical energy storage, carbon dioxide adsorption, and biomedical activity. The method employs key materials such as titanium (IV) isopropoxide (TTIP) (100), isopropanol (IPA) (200), 0.01-2M aqueous sodium hydroxide (NaOH) solution (300), deionized water (400), and alcohol (isopropanol) (500). The TTIP (100) is dissolved in the IPA (200) at a molar ratio ranging from 1:2 to 1:10 to form a clear precursor solution. The aqueous NaOH solution (300) is mixed into the precursor solution under continuous stirring for 2-4 hours at ambient temperature till precipitate begins to form. The resultant mixture solution is rested for 12-24 hours followed by filtration and repeated washing of the precipitate with the deionized water (400) and the alcohol (500) to remove residual ions and solvents therefrom. Then, the washed precipitate is dried at 60–100°C in an oven followed by calcination at 300–450°C for 2-5 hours to obtain the final nanomaterial with anatase and bronze phase molecular structure (600). ## (57) Abstract :

A MULTI-WIRE FEEDING ARC ADDITIVE MANUFACTURING METHOD FOR DEPOSITION AND STRESS CONTROL OF A WORKPIECE The disclosure herein relates to a multi-wire feeding arc additive manufacturing method (200) and a system (100) for performing multi-wire feeding arc additive manufacturing. The method (200) utilizes a multi-wire deposition and processing system (104), a power source (106), and an adaptive voltage control (AVC) system (108) to perform the steps of preheating (202) a surface of substrate or previously deposited layer of material, depositing (204) a layer of material, and sequentially smoothing (206), cooling (208) and pulse peening (210) the deposited layer, and repeating these till the formation of the workpiece. The method reduces residual stress and thermal gradient in the workpiece, minimizes cracking, improves metallurgical bonding, provides workpiece with enhanced surface finish and reduced surface roughness thereby minimizing post-processing needs, and has a higher deposition efficiency and lower build time. ## (57) Abstract :

Abstract A novel method for synthesizing thin coatings of nickel cobalt tungstate on solid surfaces is presented. In this approach, nickel (Ni<sup>2+</sup>) and cobalt (Co<sup>2+</sup>) cations, along with tungsten (WO<sub>4</sub><sup>2-</sup>) anions, are adsorbed onto the substrate through electrostatic interactions. By increasing the number of successive ionic layer adsorption and reaction (SILAR) cycles, the deposited mass of the material grows, ultimately forming adherent coatings. Structural and morphological characterization via X-ray diffraction (XRD) and field emission scanning electron microscopy (FESEM) revealed that the nickel cobalt tungstate coatings exhibit a monoclinic crystal structure and a porous nanosphere-like morphology with random arrangement. The electrochemical performance of the nickel cobalt tungstate-coated electrodes was evaluated using cyclic voltammetry (CV), galvanostatic charge-discharge (GCD), and linear sweep voltammetry (LSV) techniques. The electrodes demonstrated a remarkable specific capacitance of 1627 F g<sup>-1</sup> at a current density of 1 A g<sup>-1</sup>, highlighting their potential for high-performance energy storage applications. Towards the oxygen evolution reaction application, the nickel cobalt tungstate thin coating catalyst exhibits an overpotential of 249 mV at 10 mA cm<sup>-2</sup> current density. The synthesized nickel cobalt tungstate through successive ionic layer adsorption and reaction method is suitable candidate as a cathode in supercapacitor and electrocatalyst in water splitting applications.

(57) Abstract :  
ABSTRACT BIOMARKERS FOR THE DETECTION OF ANTIBIOTIC-RESISTANT BACTERIAL INFECTIONS DERIVED NEUROLOGICAL DEFORMITIES  
This invention relates to the domain of biomedical diagnostics and prognostics, with a specific emphasis on multi-omics-based risk stratification of neurological disorders associated with antibiotic resistance gut bacterial infections. The approach leverages a systems biology framework that integrates lipidomics, metabolomics, immunoprofiling, and advanced bioinformatics pipelines to characterize molecular perturbations along the gut-brain axis. The technological platform encompasses the development of point-of-care diagnostic tools, and the cross-fluid biomarker interrogation of clinically relevant analytes derived from blood, cerebrospinal fluid, and saliva. By enabling high-resolution, multi-parametric profiling, this invention facilitates personalized medicine applications, particularly for the early detection, monitoring, and prognosis of multidrug resistant infection associated neurological phenotypes, including but not limited to neurodegenerative and neuroinflammatory conditions. The invention situates itself at the intersection of translational omics technologies and precision healthcare diagnostics.

(57) Abstract :  
Embodiments of the present disclosure relate to a system (100) and a method (400) for remote control of appliances. Configured for retrofit installation, the system (100) fits behind existing switchboards without structural changes. The system (100) features customizable and replaceable relay switches (106) for controlling appliances. With built-in voice control, the system (100) eliminates the need for third-party speakers, providing offline and online voice command functionality. Supporting both Wi-Fi and Bluetooth Low Energy (BLE), the system (100) integrates wired and wireless devices, including legacy appliances with IR remotes. Users can operate the system (100) via a smartphone app (114), voice commands, or traditional wall switches, catering to all preferences. The modular configuration of the system (100) promotes sustainability, offering flexibility, easy upgrades, and compatibility with diverse smart home setups for a convenient, cost-effective automation solution.

(57) Abstract :

Smart Robotic Ayurvedic Dispenser with AI-Based Dosha Diagnosis for Rural Use This invention describes an artificial intelligence-enabled, portable, solar-powered robotic apparatus for individualized Ayurvedic diagnosis and automated herbal medicine dispensing. The system integrates biofeedback-based Naadi analysis using photoplethysmogram (PPG), electrocardiogram (ECG), and galvanic skin response (GSR) sensors to determine the user's dosha profile. A vernacular natural language processing (NLP) module captures symptom inputs through voice interaction. An embedded AI engine synthesizes physiological and linguistic data to infer dosha imbalances and selects corresponding Ayurvedic formulations. A robotic dispensing subsystem retrieves and prepares the prescribed medicine from RFID-tagged, temperature-controlled containers, delivering it in capsule, lepa, decoction, or oil form. The system includes biometric authentication, Aadhaar integration, AES-256 encrypted health record management, and operates autonomously in offline, resource-limited settings using a solar-charged battery. The invention ensures hygienic, standardized, and context-aware Ayurvedic healthcare delivery in underserved geographies, combining traditional diagnostics with advanced automation, AI inference, and secure digital health infrastructure.

(57) Abstract :  
ABSTRACT A WICK MESH GLAUCOMA DRAINAGE DEVICE The present invention may relate to ophthalmic surgical devices, particularly a wick mesh glaucoma drainage device (24a, 24b) for treating glaucoma conditions. The wick mesh glaucoma drainage device (24a, 24b) may comprise a porous structure configured for capillary-mediated fluid transport. The device may comprise a base portion and at least one projection portion. The base portion may be configured for placement over a trabeculectomy opening (20) at corneoscleral junction beneath a scleral flap in an eye having an eyelid (12), cornea (14), and pupil (16). The at least one projection portion may extend from the base portion and may be configured to protrude beyond an edge of the scleral flap when implanted. The porous structure may enable the base portion to collect aqueous humor through a pre-drainage chamber and may distribute the aqueous humor through the at least one projection portion to a subconjunctival space through passive capillary action. [To be published with FIG. 1]

FIG. 1

(54) Title of the invention : A SCLERAL-BASED DIGITAL TONOMETER FOR MEASURING INTRAOCULAR PRESSURE

|                                                                                                                                                                                                                                                                                                                                                                                  |  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

(57) Abstract :  
ABSTRACT A SCLERAL-BASED DIGITAL TONOMETER FOR MEASURING INTRAOCULAR PRESSURE A scleral-based digital tonometer for objective intraocular pressure measurement independent of corneal condition is disclosed. The device features two biocompatible pressure-sensing probes for bilateral scleral contact, a digital processing unit with pre-calibrated algorithms, age-specific calibration modes, real-time visual feedback via color indicators, and a digital display for results. Portable and ergonomic, it mimics traditional finger palpation while enabling accurate measurements across varied patient populations including pediatric, post-surgical, and immobilized patients. [To be published with FIG. 1]

(57) Abstract :  
ABSTRACT A GLAUCOMA DRAINAGE DEVICE The present invention may relate to a glaucoma drainage device (24) in the field of medical devices for treating ophthalmic conditions. The glaucoma drainage device (24) may comprise a thin silicone tube (32) that may be formed into a closed loop configuration for regulating intraocular pressure. The thin silicone tube (32) may comprise at least one entry opening (28) that may be located on periphery of the closed loop configuration for receiving aqueous humor from a trabeculectomy opening (20). The thin silicone tube (32) may further comprise a plurality of exit openings (34) that may be located on periphery of the closed loop configuration for regulating aqueous humor outflow to prevent hypotony and over-filtration. The glaucoma drainage device (24) may include at least one fixation point (26) that may be configured to secure the glaucoma drainage device (24) beneath a scleral flap (22). [To be published with FIG. 1]

(57) Abstract :

This invention comes with an intelligent helmet system embedded with a motorcycle ignition circuit to provide ignition only when the rider has on a helmet and is sober. It also comes with real-time detection of accidents through vibration sensors and emergency SMS notifications to registered numbers via a GSM module. With the optional GPS integration, it offers real-time location sharing, greatly enhancing road safety and emergency response for two-wheeler users.

(57) Abstract :

Fire Rescue Bot is an advanced robotic systems designed to work in hazardous environments. The robot detects fire and gas leakage using the MQ-2, and sends real-time video using the ESP32-CAM. The robot uses the Arduino UNO to controller it, there are two means of communication (Bluetooth and FU), so that the robot can be totally autonomous in fire affected areas to send notifications. Future work will include the implementation of Artificial intelligence (AI) so the robot can detect humans without them understudying and avoid obstacles with computer vision techniques. The first social goal is to assist missing person's rescue teams and increase the chances of humans surviving hazardous situations. The systemic goal is to reduce situations of hazards causing a delays in emergency responders in industrial, household and defence rescue situations.

(57) Abstract :  
Methods and systems for performing energy-aware service delivery in wireless communication networks. Embodiments disclosed herein relate to methods (200) and systems (100) for providing energy-aware service delivery in wireless communication networks by adjusting Quality of Service (QoS) for individual services. The methods (200) include collecting energy-related information (for example, energy availability, and energy source type (renewable and non-renewable)) to analyze energy usage at service/UE granularity, and adjusting QoS for individual services in a network (102) based on the collected energy-related information. The methods (200) include a dedicated Energy Management Function (EMF) to coordinate UE/service requirements and energy information (for example, energy usage) for energy-aware network decisions. (57) Abstract :

The present invention introduces a game-changing approach for addressing the increasing need for high-efficiency and low-latency processing in distributed networks is edge computing. In order to improve computational efficiency and resource usage, this study suggests an edge computing framework for dynamic resource allocation that makes use of convex optimization and linear programming approaches. Based on real-time restrictions including processing power, energy consumption, and latency requirements, the framework dynamically distributes tasks to edge nodes. While linear programming offers computational simplicity for linear allocation problems, convex optimization techniques are used to guarantee globally optimal solutions in non-linear resource scenarios. Through the integration of these mathematical techniques, the suggested system adjusts to diverse edge situations and varying workloads. When compared to conventional allocation algorithms, simulation findings show notable gains in job completion time, energy efficiency, and system scalability. With support for a variety of IoT, smart city, and autonomous system applications, this framework provides a reliable and adaptable approach to resource management in contemporary edge computing infrastructures. (57) Abstract :

**ABSTRACT BIOMARKERS FOR THE DETECTION OF INFECTION DRIVEN DYSBIOTIC GUT AND NEUROLOGICAL DISEASES** This invention relates to the domain of biomedical diagnostics and prognostics, with a specific emphasis on multi-omics-based risk stratification of neurological disorders associated with gut microbiota dysregulation. The approach leverages a systems biology framework that integrates lipidomics, metabolomics, immunoprofiling, and advanced bioinformatics pipelines to characterize molecular perturbations along the gut-brain axis. The technological platform encompasses the development of point-of-care diagnostic tools, and the cross-fluid biomarker interrogation of clinically relevant analytes derived from blood, cerebrospinal fluid, and saliva. By enabling high-resolution, multi-parametric profiling, this invention facilitates personalized medicine applications, particularly for the early detection, monitoring, and prognosis of gut dysbiosis-associated neurological phenotypes, including but not limited to neurodegenerative and neuroinflammatory conditions. The invention situates itself at the intersection of translational omics technologies and precision healthcare diagnostics.

(57) Abstract :

Abstract Title; "A rapid detection test for Saliva/" In an aspect of the present invention rapid detection test for saliva is provided for the crime investigation, Saliva is a watery fluid produced in the mouth of human is a source of Enzymes, Amylase (for carbohydrate digestion), Lingual lipase (for fat digestion), of that amylase useful in digestion of carbohydrate which break down it in sugar, the saliva is allowed to react with starch deposited on the paper and incubated for 10 minutes to one hour. Addition of iodide solution after incubation results in development of dark color spot with starch present on the paper indicating absence of saliva or if color not develops due to break down of starch in to glucose revealing presence of saliva. The RDT shows results within 10 minutes of incubation, the same is used to detect saliva at the crime site.

(57) Abstract :

This project presents a smart chessboard system designed to enhance the gameplay experience by automatically detecting the position of chess pieces and validating moves in real time. The system utilizes a matrix of reed switches embedded beneath the board squares, with multiplexers enabling efficient scanning of multiple inputs. An Arduino Nano microcontroller serves as the core controller, processing sensor data, enforcing chess rules, and managing player timers. A push-button timer switch and an I2C LCD display provide intuitive time control and visual feedback. This motor-free, cost-effective system ensures accurate move validation and fair play, making it suitable for casual players and competitive environments alike. The design's simplicity and scalability provide a foundation for future enhancements, including network connectivity and advanced game analysis features.

(57) Abstract :

This project presents a smart vehicle security system designed to prevent unauthorized driving by implementing a dual-layer authentication mechanism. The system uses an RFID reader and a fingerprint sensor to verify a driver's identity before granting access to the vehicle. An ESP8266 microcontroller serves as the core controller, coordinating input from the RFID and biometric modules, displaying prompts via an LCD, and controlling the ignition relay. Only upon successful authentication from both sources is the ignition system activated. All access attempts are logged for traceability and accountability. The system is scalable, cost-effective, and suitable for various applications, including personal cars, commercial fleets, and rental services. With built-in Wi-Fi, the ESP8266 also opens possibilities for real-time data logging and mobile integration in future developments. This approach significantly enhances vehicle security, ensures driver accountability, and sets the foundation for smarter transportation system.

(57) Abstract :

The prototype presents a cost effective, and an efficient way to measure insulation resistance between two circuits, where conventionally one of the circuits is an Isolated Terra system. This resistance is measured by injecting a 5-volt signal into the HV positive line and detecting the presence of the same signal in the LV ground. We measure the presence of the signal by reading the voltage drop before the 10 kΩ resistor. A voltage drop is detected only if there is some current flowing between the two circuits, therefore, ideally there should be no voltage drop. Upon detecting a drop, we calculate the leakage current, then the insulation resistance. The insulation resistance is displayed on the LCD display, and all three mentioned values are logged in a csv file on the SD card at 0.1 Hertz. These logged values can be used to understand patterns in insulation breaches, which help in eliminating flaws in the circuits. This concept finds heavy usage in the automotive, shipping, and core electrical industries.

(57) Abstract :

Smart smoke alarm detector using AI ABSTRACT: Fire safety is a vital issue in high-risk sectors. These sectors have considerable risks from fire and smoke dangers owing to their operations, which frequently entail combustible materials, heavy machinery, or perilous settings. Notwithstanding advancements in conventional fire detection and smoke detection systems, numerous workplaces continue to face challenges regarding prompt response and efficient avoidance. Workplace accidents resulting from inadequate safety measures might lead to possible fatalities annually. It can encompass both downtime and operational expenses. Consequently, recognising and identifying threats constitutes the initial stage in risk mitigation. Vision facts AI's smoke and fire detection system is specifically engineered to monitor, analyse, and identify a variety of risks that may pose potential hazards. Early detection not only prevents escalation but also preserves lives and property. It can be deployed both outside and indoors, detecting dangers more rapidly than most conventional sensors. It delivers exceptional accuracy, hence obviating the necessity for frequent recalibrations compared to traditional sensors. One of the advantageous features of Vision Facts AI that distinguishes it from competitors is its seamless integration with existing systems.

(57) Abstract :

ABSTRACT VLSI-Based Intelligent Control Unit for Real-Time Automation System The present invention relates to a VLSI-based intelligent control unit specifically designed to perform real-time automation tasks with high accuracy and speed. The system integrates advanced VLSI architecture with embedded artificial intelligence logic to enable rapid processing of sensor inputs and precise generation of control outputs. It addresses latency issues in conventional automation systems by utilizing parallel processing cores and pipelined execution mechanisms within a compact chip. The control unit features AI-driven modules capable of learning from operational data, detecting anomalies, and making predictive control decisions without the need for external computing resources. With support for dynamic reconfiguration and adaptive control, the invention offers enhanced responsiveness and reliability in automation environments. The system can interface seamlessly with various sensors and actuators using standard communication protocols, making it highly compatible and scalable. This invention is applicable in diverse domains such as industrial robotics, smart manufacturing, healthcare devices, automotive systems, and intelligent infrastructure. It delivers low-power, high-performance automation with built-in intelligence, offering a next-generation solution for real-time control in embedded and edge-based applications.

(57) Abstract :  
ABSTRACT Smart Business Decision Support System using Predictive analytics and Market Trends The invention relates to a Smart Business Decision Support System (SBDSS) designed to enhance strategic, tactical, and operational decision-making by integrating predictive analytics with real-time market trend data. The system utilizes machine learning algorithms and artificial intelligence techniques to analyze historical business data and forecast key performance indicators such as sales, demand, and customer churn. Simultaneously, it captures external market signals like consumer sentiment, competitor behavior, and economic trends to provide a comprehensive understanding of the business environment. The system comprises various integrated components, including a predictive analytics engine, market trend aggregator, data preprocessing module, visualization dashboard, and recommendation engine. It processes both structured and unstructured data, applies advanced analytical models, and delivers insights through an intuitive dashboard interface. Users can input business objectives and receive real-time forecasts, scenario simulations, and automated strategic recommendations tailored to their goals. This intelligent decision support system enables businesses to respond proactively to changing market dynamics, reduce decision-making uncertainty, and optimize overall performance. It is applicable across various industries such as retail, finance, healthcare, and manufacturing, offering a scalable and flexible solution for data-driven business management.

(57) Abstract :  
ABSTRACT Automated Theorem Proving System Using AI Algorithms for Mathematical Proof Generation The present invention relates to an automated theorem proving system that uses artificial intelligence (AI) algorithms to generate formal mathematical proofs. The system is designed to reduce the need for manual intervention by leveraging advanced AI models, including deep learning and reinforcement learning, for analyzing theorem statements, retrieving relevant mathematical knowledge, and constructing logical proof sequences. It addresses the limitations of traditional symbolic theorem provers by introducing a hybrid model that combines data-driven reasoning with formal logic validation. The system comprises several core modules: an input interface for receiving the theorem, a mathematical knowledge base, a hybrid AI proof engine, a symbolic inference checker, and an output generator. The proof engine predicts logical steps using trained neural models while optimizing proof strategies through reinforcement learning. All generated steps are validated using a symbolic logic-based inference engine, ensuring logical soundness and mathematical accuracy. The final proof is verified through a formal proof checker and presented in a user-friendly format. This invention provides a powerful tool for researchers, educators, and mathematicians by automating the otherwise complex and time-intensive process of theorem proving. It enhances the speed and accuracy of mathematical discovery, supports multiple input and output formats, and enables human-AI collaboration in formal reasoning tasks. The proposed system represents a significant advancement in the field of automated reasoning and intelligent mathematical systems.

## (57) Abstract :

This project presents a cost-effective, IoT-based structural health monitoring and earthquake detection system that integrates a custom-designed Truss Box embedded within a Cement Curing Block. The Truss Box houses a Load Cell Sensor that continuously measures the stress and strain exerted on the structure. Coupled with an HX711 amplifier, the Load Cell sends real-time data to a Raspberry Pi 5 for processing. Additionally, a Vibration Sensor is employed to detect seismic activity, allowing for both structural load monitoring and earthquake detection. All data is processed using Python on the Geany IDE and visualized through dynamic graphs, providing clear insights into structural behaviour under different load conditions. A key innovation in this system is the Truss Box, which enhances sensor integration and simulates realistic stress distribution found in structural elements. This setup not only ensures more accurate and stable readings but also increases the reliability of long-term monitoring. The system supports remote access and continuous observation through IoT connectivity, making it especially valuable in earthquake-prone areas and for civil engineering applications. Its scalable design, low cost, and predictive maintenance capabilities position it as a practical alternative to traditional structural assessment methods.

(57) Abstract :  
The rapid evolution of digital media and artificial intelligence (AI) has transformed communication, necessitating new theoretical frameworks. This study examines the role of emojis in digital communication, particularly in gender-based usage patterns, and proposes an AI-mediated theory of communication. The research focuses on youth in Mumbai, employing a four-year study to analyze perceptions of gender representation through emojis. Prior research highlights that emojis function as extensions of human emotion, offering a fast and engaging way to express feelings. However, there remains a gap in understanding gender-specific emoji usage. A survey conducted with 525 respondents (59% female, 41% male) via an online questionnaire developed with experts in psychology and media provided insights into this phenomenon. Findings indicate that women use emojis more frequently, and their usage contributes to breaking communication barriers by fostering inclusivity and cultural exchange. A Digital Communication Model was developed to explain how communication functions on digital platforms through visuals and emojis. This model challenges the traditional Uses and Gratifications Theory (UGT), arguing that AI-driven recommendations shape user behavior more than individual gratification. The study suggests that AI influences how users encode and decode messages, altering their cognitive engagement in digital interactions. The AI-mediated theory of communication proposed here asserts that AI reduces users' cognitive abilities by subtly dictating message encoding and comprehension. This shift potentially reverts users to passive consumers rather than active participants in communication. The theory is based on three core assumptions: (1) the sender has limited knowledge of technology, (2) AI dictates how messages are encoded, and (3) the sender's comprehension is shaped by AI influence. By exploring these dynamics, the study advances understanding of AI's impact on digital communication and offers a framework for analyzing the intersection of technology, cognition, and human interaction.

## (57) Abstract :

The present invention relates to an emergency and vehicle accident alert system related to a movement of an ambulance tracked by computing devices. The system includes a plurality of sensors, and the plurality of sensors being enabled with IoT configurations. The plurality of sensors are configured to acquire data relating to accidents, hospitals, and police stations. A microcontroller, configurable as a central processor, is connected to each of the plurality of IoT sensors for collecting data from the sensors and configuring data transfer to cloud platforms. A Global Positioning System (GPS) member is connected to the microcontroller and the plurality of sensors for configuring real-time location tracking for ambulances and health car users, respectively. A memory is connected to the plurality of IoT sensors, the microcontroller, and the GPS member for storing and retrieving data acquired regarding accidents, hospitals, and police stations. To be published with figure 1.

(57) Abstract :  
The present disclosure relates to multimodal emotion recognition system for sentiment and emotion analysis across multiple inputs and a process thereof.The multimodal emotion recognition system comprising: a data acquisition unit configured to receive a plurality of data inputs from users, wherein the plurality of data inputs comprising a text input, an image input, an audio input and a video input; a data pre-processing unit configured to process the plurality of data inputs, a sentiment and emotion analysis unit configured to extract sentiment and emotion indicators from the text input, wherein the sentiment analysis unit is further configured to identify positive, negative, and neutral sentiment, as well as specific emotions such as joy, anger, and sadness; an image and video feature extracting unit configured to analyze facial expression by using pre-trained convolutional neural networks (CNNs), wherein the image and video feature extracting unit is further configured to extract emotions such as happy, sad, anger, fear, surprise, or disgust based on facial movements in frames of the image and video; an audio feature extracting unit configured to extract emotion-related linguistic features from spoken words; a visualization unit configured to display results of the plurality of data inputs from the users.

## (57) Abstract :

The present disclosure relates to a system for sorting, handling and representing data through visualization technique, said system comprising an user based platform configured to allow students to interact with visualizations by modifying inputs data, wherein the inputs are arrays values, linked lists, binary trees structures and graphs; a performance comparison log unit configured to provide performance comparison logs of the data; a progressive learning unit configured to provide a structure as a learning tool with progressive modules, starting from fundamental data like arrays and linked lists and progressing through more complex topics such as graphs and heaps; a processing unit configured to generate and provide pseudocode alongside the visual representation of the inputs data, wherein the processing unit configured to correlate graphical steps with an underlying logic, wherein the processing unit is further configured to reinforce a connection between the data and its textual representation, a data visualization unit configured to visually represent a plurality of data structures such as arrays, linked lists, binary trees and graphs in real-time on a user interface, wherein the data visualization unit configured to provide nodes change color during traversal, visually representing the current path and traversal order, wherein the visualizations are enhanced with animations and transitions, wherein colour schemes are provided in the user interface to provide visual cues to guide focus of the student on the data.

(57) Abstract :  
ABSTRACT: AI-Powered Real-Time Speech Plagiarism Detection System This invention describes that with the rise of digital communication, ensuring the originality and integrity of spoken content has become essential in academic, professional, and public domains. The AI-Powered Real-Time Speech Plagiarism Detection System addresses this need by detecting both verbatim and semantic plagiarism in spoken language—capabilities not commonly found in traditional text-based tools. Leveraging Artificial Intelligence (AI), Natural Language Processing (NLP), and Automatic Speech Recognition (ASR), the system converts live audio into text and compares it against extensive source archives. Using advanced string-matching and semantic similarity models, it accurately identifies direct copying, paraphrasing, and mimicry. The intuitive interface displays flagged content with similarity scores and source references, enabling rapid evaluation. Multilingual support, data privacy safeguards, and seamless integration through APIs make it ideal for use in education, healthcare, media, and legal sectors. This system not only redefines how spoken content is authenticated but also promotes ethical communication practices across institutions and industries.

(57) Abstract :  
ABSTRACT A SELF-RETAINING NASOLACRIMAL DRAINAGE DEVICE The present invention relates to the field of ophthalmology and otorhinolaryngology, particularly to medical devices for treating nasolacrimal duct obstructions. A permanent nasolacrimal drainage device (12) comprises a C-shaped continuous hollow silicon tube (24) configured to form a loop pathway through upper and lower canaliculi with ends (8a, 8b) positioned to discharge biological fluid into a lacrimal sac (22). The device (12) further comprises a plurality of perforations (18) including upper perforation (18a), central perforation (18b), and lower perforation (18c) configured to receive biological fluid from the ocular surface of eye (14). The device additionally comprises a radiopaque strip (30) embedded within the continuous hollow silicon tube (24) for radiographic visualization and structural support. Semicircular grooves (20) formed on outer walls of canalicular portions enhance grip and prevent displacement. The self-retaining design eliminates sutures while providing mechanical eyelid support, thereby delivering comprehensive long-term drainage solutions without requiring removal procedures. (57) Abstract :  
ABSTRACT A NASOLACRIMAL PROBE RETRIEVER The present disclosure relates to a nasolacrimal probe retriever (12) for retrieving a metallic nasolacrimal probe (20) during dacryocystorhinostomy surgery. The nasolacrimal probe retriever (12) may comprise a curved metallic body (24) having a proximal end (28) and a distal end (22). The curved metallic body (24) may define an internal lumen (36) extending from the proximal end (28) to the distal end (22). The curved metallic body (24) may be configured for navigation through a nasal cavity (16). The internal lumen (36) may be configured to receive and guide the metallic nasolacrimal probe (20). The distal end (22) may comprise an atraumatic tip configured to minimize trauma to nasal mucosa. The nasolacrimal probe retriever (12) may further comprise a suction connector (32) disposed at the proximal end (28) configured to connect to surgical suction tubing. The curved metallic body (24) may be fabricated from an autoclavable material. [To be published with FIG. 2]

(57) Abstract :

**ABSTRACT A SYSTEM AND METHOD FOR WIRING ACCESSORIES OF DOMESTIC AND COMMERCIAL ELECTRICAL APPLICATIONS** The present invention relates to a wiring accessories system that includes a switching system for domestic and commercial electrical applications. The switching system includes a wall switch plate adaptor having an aperture of a shape and size larger than a cross-section of a corresponding switch; an engraving disposed at the wall switch plate adaptor, wherein the engraving comprises a height, having dimensions conforming to the corresponding switch, for a vertical configuration of the switch plate, and wherein the engraving comprises a width, having dimensions corresponding to the electrical switch, for a horizontal configuration of the switch plate. A plurality of raised areas is disposed on the opposite sides of the wall switch plate adaptor for providing reinforcement support to the engraving. A plurality of grooves is disposed around the wall switch plate adaptor for accommodating a configuration of the switch for reducing risk of hazardous contact with live electrical parts associated with the switch plate assembly; a housing is sized to fit at least partially inside the wall switch plate adaptor for containing a plurality of conducting and insulating modules. A grid plate cover is provided, comprising a touch-sensitive surface. A plurality of sensors is disposed behind the touch-sensitive surface for sensing a user interaction with the touch-sensitive surface. A socket including a safety shutter and a shutter spring. A locking and releasing means is configured for integrating components of the switch plate assembly for a locking state and a releasing state that respectively comprise maintaining the integrity of the switch plate assembly against physical intervention. A calibrator means is configured for confirming the dimensions of the switch plate assembly with dimensions of components, interior, and exterior of the switch plate assembly. To be published with figure 1.

(57) Abstract :

The evolution of question-answering (QA) systems has dramatically reshaped human-computer interaction, with AI-driven conversational agents becoming essential across various domains. From Joseph Weizenbaum's ELIZA in the 1960s, which used early natural language processing (NLP) techniques to simulate basic conversation, to the emergence of advanced models like GPT-2, Mistral and LLaMA, the capabilities of these systems have evolved significantly. Today, conversational agents are capable of understanding and responding to complex queries and exhibit human-like conversational depth. This research explores the journey of QA systems, from rule-based methodologies to state-of-the-art deep learning techniques. Despite this progress, existing systems still face critical challenges, particularly in managing ambiguous questions, retaining conversational context, and commonsense reasoning tasks. To tackle these issues, this research introduces LLMHarmonized, an innovative self-learning agent that integrates the capabilities of two leading models Mistral and LLaMA2 within a hybrid architecture called the Self-Learning Intelligent Agent. This agent continually improves its performance through interaction and feedback, enhancing its accuracy, contextual understanding, and ability to resolve ambiguity. The framework's effectiveness is demonstrated through extensive experimentation on benchmark datasets. On the CoQA dataset, LLMHarmonized achieves an outstanding F1 score, illustrating its ability to maintain context and deliver precise answers in conversational settings. On the NQ-OPEN dataset, which tests ambiguity resolution in open-domain questions, showcasing its ability to handle challenging queries. Moreover, the agent demonstrates strong commonsense reasoning, achieving an accuracy on the CommonsenseQA dataset, highlighting its capacity for understanding and applying everyday logic. By leveraging a self-learning approach and integrating advanced language models, LLMHarmonized significantly advances the capabilities of modern QA systems. This research addresses persistent challenges in context comprehension and ambiguity handling and sets the stage for future advancements in conversational AI, driving the development of smarter, more adaptive, and human-like conversational agents.

(57) Abstract :  
"A WATER-DISPERSIBLE NUTRACEUTICAL POWDER FORMULATION AND PREPARATION METHOD THEREOF" The present invention provides a platform technology for the development of water-dispersible nutraceutical powder formulations comprising plant extracts. The invention further discloses a method for preparing the nutraceutical powder formulation, specifically designed to enhance the ease of consumption, solubility, stability and palatability of the incorporated extract. The approach is solvent-free, eco-friendly, and scalable solution. The resulting formulations are suitable for use in pharmaceutical, nutraceutical, and cosmeceutical applications, particularly in products aimed at therapeutic, regenerative, anti-inflammatory, antioxidant, and general wellness benefits.

(57) Abstract :

Abstract NON-INVASIVE BIOMARKER DETECTION FOR SCREENING, DIAGNOSIS AND STAGING OF ORAL SQUAMOUS CELL CARCINOMA The present invention provides a non-invasive method and platform for the early detection, diagnosis, and staging of oral squamous cell carcinoma (OSCC) using saliva and oral mucosal lesion scrapings. The method involves metabolomic, lipidomic, and proteomic profiling via LC-MS to identify molecular biomarkers associated with OSCC development and progression. The identified biomarker panel significantly distinguishes between OSCC and healthy or OSMF patients, offering a highly sensitive and specific diagnostic alternative to invasive biopsy. The invention includes a panel of biomarkers for designing diagnostic kit, enabling personalized disease monitoring and risk stratification.

(57) Abstract :

A multi-functional teaching assistive device comprising of a board-like panel 101 serving as a writable surface and a digital projection screen, a built-in microphone 102 enables voice commands, an automated covering unit 103 with cleaning components, including a spray unit 106 and motorized dusters mounted on a motorized two-axis slider, cleans the board 101 based on a photoelectric sensor, a retracting projector 117 with a dedicated deployable white sheet 119 for digital content, a planar manipulator assembly 122 with telescopic rods 121 precisely positions a gun barrel arrangement 124 housing multi-coloured chalks via suction units for automated writing or drawing, enabling hands-free operation, an integrated thermal imaging camera 113 detects student presence for attendance and triggers board 101 covering during unoccupied periods, an audio output unit 126 for reading instructions from the board 101.

(57) Abstract :  
A high-jump training and assistance system comprising a platform 101 with adjustable columns 102 via vertical sliding rail 103, a crossbar 104 mounted along the transverse axis from columns 102, a handlebar 105 with a biometric scanner 106 for user authentication, a sensor suite 110 with pressure, force, and gyroscopic sensors for detecting grip strength, asymmetry, and hand alignment, a speaker 111 for real-time voice alerts, a holographic projection unit 112 for spatial jump guidance, an artificial intelligence-based imaging camera 113 with imaging processor for movement monitoring and posture analysis, an inflatable landing unit with motorized rollers 115 and inflatable sheets secured via motorized clippers 117 on a parallel slider track 118 for safety, an ultrasonic sensor for motion tracking and collision detection, a head gear 119 with EEG sensors for neuro-feedback on mental focus and fatigue, LEDs 120 on the crossbar 104 for visual fatigue and readiness alerts.

(57) Abstract :  
The present invention relates to an agentic AI-powered social business networking system and method that enables seamless interaction between users and multiple business ecosystems through a unified, intelligent platform. The system employs autonomous AI agents configured to manage user-specific roles, preferences, and workflows, and to execute business functions such as scheduling, diagnostics, transactions, and service delivery. A multi-agent synchronization framework ensures real-time coordination of data, roles, and services across distributed environments. The platform further provides domain-specific personalization, offline and hybrid operational support, and a decentralized identity mechanism for universal access. Interaction is facilitated through a distributed network interface embedded within collaborative user experiences. The system is deployable across on-premise, private, or public cloud infrastructure with integrated privacy controls and compliance features. The invention offers scalable, adaptive, and intelligent business networking by integrating automation, personalization, and cross-platform connectivity within a secure, AI-driven ecosystem.

(57) Abstract :  
The invention presents a hybrid approach for hyperparameter tuning of convolutional neural networks (CNNs) using genetic algorithms and Bayesian optimization. Designed to enhance classification performance on image datasets such as MNIST, the method automates the selection of key architectural parameters—layer count, neuron size, dropout rates, and learning rate. Genetic algorithms explore configurations through evolution-inspired operations, while Bayesian optimization models performance with probabilistic surrogates to guide sampling. Experimental evaluation demonstrates superior accuracy and training efficiency over manual and grid search methods. This invention provides a robust, scalable solution for optimizing deep learning models in image processing applications.

(57) Abstract :

The present invention relates to an autonomous cattle feeding system that integrates machine vision, mobile communication, and robotic automation to ensure precise and efficient livestock feeding. The system consists of a mobile application for user input, Bluetooth communication with a microcontroller (Arduino Mega), and real-time cattle detection using a custom-trained YOLOv8 deep learning model on the mobile device. The robotic unit navigates along a predefined path using IR sensors, detects and avoids obstacles using an ultrasonic sensor mounted on a servo and MPU6050, and accurately dispenses feed using a set of load cells interfaced through HX711 modules. Additionally, it includes a battery monitoring unit using LM3914 IC and a relay-controlled status circuit to assess operational readiness. The robot continues feeding based on the input data and returns to a charging/refill base station once feeding is complete or the battery/feed level is insufficient.

(57) Abstract :

The invention offers a wearable aid as smart glasses that translate speech into real-time text for hearing or speech-impaired individuals. The system includes a microphone to record ambient speech, a microcontroller to process signals, and a wireless communication module (e.g., Wi-Fi or Bluetooth) to provide connectivity with cloud-based speech recognition. The transcribed dialogue is shown on a tiny heads-up display (HUD) inside the lens area, enabling the user to view the dialogue in a natural way in his/her line of sight. The equipment operates with a small rechargeable battery and is made for portability, hands-free wear, and every-day wear. This invention improves personal communication, fosters social integration, and facilitates independent living by offering an unobtrusive, real-time, and easy-to-use solution to accessible communication.

(57) Abstract :

The present invention relates to an herbal composition and its method of preparation for the effective management of post-radiation oral mucositis and dermatitis. The formulation incorporates a synergistic blend of standardized herbal extracts, including Haridra (Curcuma longa), Daruharidra (Berberis aristata), Triphala (Amalaki, Haritaki, Bibhitaki), and Yashtimadhu (Glycyrrhiza glabra), known for their anti-inflammatory, antioxidant, and wound-healing properties. The gel formulation utilizes Carbopol 940, Triethanolamine (TEA), Glycerine, and distilled water to create a stable base with a pH of 6.8–7.0, suitable for oral mucosal application. Additionally, a herbal lotion variant is prepared using beeswax, white paraffin wax, natural oils/ghee, and the herbal gel to treat radiation-induced skin inflammation. The invention provides a dual therapeutic solution for external and mucosal radiation injuries, ensuring patient comfort, faster healing, and minimal side effects. The composition is prepared using a hydroalcoholic extraction method and formulated under controlled conditions to preserve bioactivity and enhance efficacy.

(57) Abstract :

The present invention relates to a method of preparing the steam activated herbal therapy pack. The herbal therapy pack consists of a biodegradable, non-heat-sealed pouch containing pre-measured dried Ayurvedic herbal ingredients. Upon activation through steam at approximately 110°F, the herbs are released into a therapeutic paste, which is then applied directly to the affected body area. The pack maintains its temperature for repeated use and can be reheated during the same treatment session. The herbal ingredients, selected for their natural healing properties, include Guduchi, Khadira, Haridra, Gokshura, and Madhuyasthi, providing targeted relief for conditions such as arthritis, muscle pain, and inflammation. The system also includes a steam activation chamber and cooling mechanism to ensure the pack reaches a safe temperature for application. The biodegradable packaging ensures environmental sustainability, making the HerbaSteam Pack a revolutionary approach to Ayurvedic therapy for both clinical and home use.

(57) Abstract :  
The present invention relates to pharmaceutical formulations, more particularly to a novel orally dissolving thin film (ODF) composition of Ondansetron Hydrochloride. This invention further offers a rapid onset of anti-emetic action by enhancing patient compliance, especially for patients suffering from chemotherapy-induced nausea and vomiting.

(57) Abstract :

In the digital era, efficient and personalized communication is crucial for professional engagement. The AI-Powered Email Generation and Personalization System integrates AI-driven email composition with LinkedIn data extraction and read receipt tracking to enhance outreach effectiveness. This system utilizes web scraping techniques to collect recipient-specific data from LinkedIn profiles, which is then processed by AI to generate context-aware, personalized emails. A built-in read receipt mechanism enables real-time engagement tracking, allowing users to optimize follow-up strategies. Developed using Next.js, Node.js, and Python, this system provides a seamless, user-friendly experience for recruiters, marketers, and professionals seeking to automate and personalize large-scale email outreach. By reducing manual effort and improving engagement rates, it streamlines communication while ensuring relevance and efficiency

(57) Abstract :

The present invention pertains to a vermicompost churning cum grading machine that is meant for automating disintegration and grading of vermicompost clods. The equipment consists of an axial feeding chute for feeding raw vermicompost; a churning unit made up of a churning drum, a rotary churning shaft, and helically mounted C-curve blades on a flange, designed to crush clods by impact, rubbing, and centrifugal force; and a sieving unit made up of a rotary sieve with adjustable mesh (usually 3–4 mm) mounted on an auxiliary rotating shaft for separating fine compost from coarse residues. The sieving and churning units are operated through a motor-driven transmission system with pulleys and belts, allowing for simultaneous use. The system involves a wheeled transportable frame, an enclosure for safety, and a tray for collecting underneath the sieve. The innovation decreases manual labor drastically, increases output quality, and minimizes efficiency under working conditions of ~25.42% moisture content and blade speed of ~5.34 m/s. It is appropriate for use on the farm and sustainable vermicompost production.

(57) Abstract :  
ABSTRACT OF THE INVENTION: This invention provides a comprehensive e-library website designed to offer students seamless and secure access to eBooks and audiobooks, fostering a more efficient and convenient learning environment. It integrates a view-only mode for eBooks with personalized watermarks displaying PRN numbers to ensure enhanced security and resource protection. The system simplifies the borrowing process through a centralized digital system and aims to address challenges related to accessibility, security, and resource management of digital academic resources. The platform will improve resource management for college libraries, enhance accessibility, and protect digital content from unauthorized distribution.

(57) Abstract :  
The present invention discloses an intelligent personal assistant system designed to enhance workplace productivity, emotional well-being, and time management through a seamless integration of hardware and software components. The assistant intelligently monitors user schedules, tracks daily activities, provides real-time reminders, and dynamically allocates time for prioritized tasks. Equipped with emotional intelligence capabilities, the system interprets user mood through voice and facial analysis, enabling context-aware interactions and empathetic responses. The hardware interface comprises a smart display, touch inputs, voice recognition, sensors, and camera integration, allowing multimodal user engagement. The software layer includes modules for task scheduling, natural language processing, emotion detection, behavioural learning, and personalised reporting. This hybrid assistant evolves with user behaviour, ensuring personalised support, proactive engagement, and a human-centric approach to digital productivity. The invention aims to bridge the gap between task automation and emotionally intelligent workplace assistance.

(57) Abstract :

This invention presents a novel method for early failure detection of lithium-ion batteries (LIBs) using a novel factor, Combined Efficiency Factor (CEF), calculated using coulombic and energy efficiency. The study involves a total of 45 lithium-ion battery cells, comprising different chemistries:  $\text{LiFePO}_4$  (LFP),  $\text{LiNiMnCoO}_2$  (NMC), and  $\text{LiNiCoAlO}_2$  (NCA). Among these, 15 cells belong to our laboratory Energy & Environmental Nanomaterials (EEN) Laboratory, while the remaining 30 cells data sourced from the publicly available dataset provided by Sandia National Laboratories (SNL). Analytical behaviour of CEF from early 10 to 50 cycles and studying its statistical features like slope, variance, standard deviation and range exhibited indication of early failure. The X-Ray Diffraction (XRD) analysis of LFP fresh, working and failed cells verified permanent structural damage in degraded cells through observable peak shifts and lattice changes. Among the different machine learning models, the gradient boosting classifier based on slope of CEF classified healthy and degraded cells more accurately than other models. This novel approach of early detection of batteries, validated with electrochemical characterization-based machine learning model, will allows proactive battery health monitoring, high reliability, improving safety and performance in real-world applications of all type of batteries, hence offer inventive technological steps and scalable solution for the betterment of society.

(57) Abstract :

The present invention provides a system and method for analyzing gender differences in emotional intelligence and personality traits using standardized psychometric assessments, data analytics, and correlation modeling. The invention captures participant responses, classifies them by gender, computes scores for emotional intelligence and Big Five personality traits, and calculates gender-specific correlations between these dimensions. It includes modules for data acquisition, scoring, statistical analysis, and visual reporting, enabling researchers, educators, HR professionals, and mental health practitioners to derive actionable insights into gender-based psychological profiles for academic, organizational, and clinical applications

(57) Abstract :

The invention pertains to an intelligent, sensor-integrated automated desk system that aims to increase user convenience, encourage wellness, and maximize energy efficiency in an office setting. The system utilizes three microcontrollers (one Arduino Uno and two Arduino Nano) to provide synchronized operation and effortless multi-sensor integration. A blend of ultrasonic sensors and DFPlayer Mini modules provides personalized greetings during the arrival of the user and timely reminders during departure. User presence also dictates automatic desk power activation or deactivation. Environmental convenience is regulated through a DHT22 sensor, heater, and relay module to track and regulate ambient temperature and humidity levels. A temperature sensor LM35 tracks the wireless charger and phone temperature; above threshold values trigger the activation of a fan and prompt the voice to ask users to take out their devices to avoid overheating. A load cell embedded under a water bottle reminds users from time to time to drink water through audio cues. An RGB LED strip with a potentiometer allows users to choose among five preset mood lighting modes (Happy, Focused, Disco, Aesthetic, Chill), accompanied by matching background music played by the DFPlayer Mini for mood boosting. An in-chair pressure sensor senses excessive sitting and encourages the user to stand up and rest. The desk also features an intelligent power switch to power auxiliary devices like the heater and charge laptops. Not only does this system integrate all these functions, but it also promotes healthier working habits, user interaction, and optimized resource usage, making it a smart move toward well-being-focused workspace spaces.

(57) Abstract :

The present invention relates to a smart power control and monitoring system for automotive headlamps, specifically designed to enhance the operational life of the headlamp and predict bulb degradation using real-time electrical parameters. This invention integrates voltage, current, and ambient light sensors with a microcontroller to intelligently monitor the headlamp's health and working conditions. The system calculates filament temperature based on measured voltage and current, estimates the bulb's electrical resistance, and predicts the remaining bulb life through defined threshold-based logic. The invention employs a relay mechanism that automatically switches the headlamp ON or OFF based on operating conditions, including overload, excessive temperature, or unnecessary use during daylight. An LDR sensor detects ambient light intensity to prevent power wastage by disabling the headlamp in bright conditions. A buzzer and LED indicator system provides alerts for fault conditions such as overload, overheating, daylight operation, or bulb weakening. An LCD interface displays real-time values of voltage, current, resistance, temperature, and estimated bulb life percentage. A button allows the user to toggle between operational data and bulb health insights. A built-in filtering method ensures more stable current readings for accurate calculations. By continuously analyzing sensor data, the system prevents damage to the bulb, optimizes energy consumption, and improves safety. This invention ensures proactive fault detection and energy-efficient headlamp operation in automotive applications. It offers a reliable, low-cost solution for extending bulb life, reducing maintenance, and enhancing user awareness, making it particularly beneficial for automotive safety and maintenance systems.

(57) Abstract :  
ABSTRACT A NASOLACRIMAL BONE TREPHINE FOR PERFORMING CONTROLLED OSTEOTOMY IN DACRYOCYSTORHINOSTOMY SURGERY The present invention may relate to a nasolacrimal bone trephine for performing controlled osteotomy in dacryocystorhinostomy surgery. The nasolacrimal bone trephine may comprise a hollow cylindrical shaft (30) having a proximal end and a distal end. A cutting assembly may be disposed at the distal end of the hollow cylindrical shaft (30), wherein the cutting assembly may comprise a circular cutting edge (16) having serrated teeth or diamond-coated surface for bone removal. A central guide pin (18) may extend axially through the hollow cylindrical shaft (30) and may project beyond the cutting edge (16) at the distal end. The nasolacrimal bone trephine may comprise a depth control mechanism that may be configured to limit penetration depth during osteotomy and a handle connection interface (12) at the proximal end that may be configured for attachment to manual or motorized drilling apparatus. (57) Abstract :

IN/PA-2352 ABSTRACT A CANALICULAR TREPHINE SURGICAL INSTRUMENT FOR RECANALIZATION OF CANALICULAR OBSTRUCTIONS The present invention relates to the field of ophthalmology and otorhinolaryngology, particularly to surgical instruments for lacrimal system reconstruction and canalicular recanalization procedures. A canalicular trephine surgical instrument (10) comprises a longitudinal body (11) configured as a handle with ergonomic grip features (28) and a metal probe (12) extending from the longitudinal body (11) with a bent configuration for enhanced maneuverability. The metal probe (12) features a star screwdriver-like tip geometry (18) with raw beveled edge configuration (20) comprising multiple radial cutting surfaces for controlled tissue penetration and obstruction removal. The instrument (10) further comprises a collection cavity (26) within the metal probe (12) for debris removal during procedures. An optional electric motor (24) provides rotational or vibrational movement with variable speed control ranging from 100-3000 RPM. The instrument effectively treats proximal, distal, and common canalicular obstructions, including post-dacryocystectomy cases, while providing superior surgical control compared to conventional straight, smooth-tipped probes. [To be published with FIG. 1]

(57) Abstract :  
ABSTRACT GAMIFIED ONLINE PLATFORM FOR MENTAL HEALTH FIRST AID TRAINING IN WORKPLACE ENVIRONMENTS The present invention discloses a gamified online training platform designed to enhance mental health awareness and first aid response capabilities within workplace environments. The system integrates structured, interactive learning with scenario-based gameplay that simulates real-life mental health challenges across four sequential levels aligned with Mental Health First Aid (MHFA) principles: Identification, Crisis Response, Communication Techniques, and Referral. Participants undergo pre- and post-assessments to measure knowledge acquisition and behavioral change. The platform features locked progression, instant feedback, scoring with penalty mechanisms, and digital badges to incentivize user engagement. Collected performance data, including test scores and time metrics, are compiled into individual and organizational-level reports. Compatible with LMS platforms, mobile, and desktop environments, this invention offers a scalable, evidence-based solution for corporate mental health training, combining cognitive and affective learning to improve early detection, empathetic communication, and appropriate referral practices in the workplace. (57) Abstract :  
ABSTRACT GRATITUDE MODEL KIT FOR ENHANCING SELF-ESTEEM AND EMOTIONAL WELL-BEING IN ORPHANED CHILDREN The present invention relates to a Gratitude Model Kit designed to foster self-esteem, resilience, and emotional well-being among orphaned children through structured positive psychology interventions. The kit comprises five distinct compartments: a To-Do List Compartment with activity prompts and role-play scripts; an Affirmation Card Compartment with customizable affirmation tools; a Gratitude Journaling Compartment with guided prompts and journals; a Star Pocket Compartment featuring reward-based visual reinforcement; and an Inspiration and Creativity Compartment with creative materials and motivational visuals. The kit uses a color-coded layout, is made from durable, child-safe materials, and includes an instruction manual for caregiver facilitation. It enables children to internalize gratitude, practice positive self-talk, and build emotional resilience with minimal supervision. The invention is scalable, cost-effective, and adaptable for use in orphanages and educational settings, providing a novel, structured alternative to traditional behavioral and educational interventions. A digital extension is also included for progress tracking and engagement. [To be published with fig.1]

(57) Abstract :  
ABSTRACT PORTABLE THERAPEUTIC KIT FOR HOLISTIC MANAGEMENT OF NEURODERMATITIS The present invention discloses a therapeutic kit (100) designed for managing neurodermatitis through a comprehensive, multi-compartment approach integrating topical treatment, sensory redirection, and behavioral guidance. The kit comprises: a first compartment containing an anti-itching cream, cotton finger cap cots, and gloves for topical relief and prevention of scratching; a second compartment with tactile engagement tools such as glee coils, thinking putty, and loofahs for anxiety reduction and sensory redirection; a third compartment housing virgin coconut oil and antiseptic wipes for skin hydration and infection prevention; and a fourth compartment including an instructional pamphlet detailing usage protocols and behavioral strategies. The kit is enclosed in a skin-friendly polyester bag with labelled sections (501, 502), a front handle (500), a back pocket (400), and numbered zippered compartments (201–204) secured by Velcro fasteners (101–104). The portable design ensures organized, secure containment and promotes regimen adherence for effective at-home dermatitis management. [To be published with fig.1]

(57) Abstract :  
ABSTRACT EXPLAINABLE AI BASED MULTI-TASK FRAMEWORK FOR FAULT DIAGNOSIS AND PREDICTION ON METRO TRAINS A fault prediction system (100) based on an explainable AI based Multi-task model (106) i.e multitask framework for fault diagnosis in the Air Production Unit of metro trains is disclosed herein. Several analog and digital sensors related to the air pressure, water pressure, oil pressure, oil levels, electrical signals and so on are used as features for the A.I algorithms. A multi-task neural network with feature sharing was developed with three outputs, each for fault type, fault location and GPS quality assessment. The LIME explainable AI technique was used to provide interpretations for the predictions made by the deep learning model based on feature importance and contributions. Finally, all the curated results are displayed on a website-based dashboard for analysis by maintenance engineers to help in predictive maintenance. On the whole, the proposed work can be of great aid for maintenance engineers for analysis of faults in APU of the metro train with high accuracy and efficiency. [To be published with Fig.1]

(57) Abstract :  
A ghee production machine (100) is described herein. The machine comprises a base frame (1), an induction heating unit (12), a container (6), a vertical frame (2), a control unit (14), a temperature sensor (6.1), a ball valve (6.2), and motor casing (3) which consisting of an electric AC motor (4), stirrer (5), digital display unit (3.1) and a plurality of control buttons. The invention pertains to the domain of food processing equipment, specifically within the sub-category of kitchen appliances aimed at simplifying and automating the traditional process ghee making for household consumption.

(57) Abstract :

A system for managing self-charging interface with multiple electrical energy storage units in an electric vehicle is disclosed. The system includes a first energy storage unit for supplying power to the propulsion system and a second energy storage unit configured to be charged during vehicle operation. A Control System monitors electrical and thermal parameters of each unit and dynamically assigns supply and charging roles using a switching assembly comprising contactors or equivalent devices. A precharge system enables safe load connection. The system further comprises a self-charging interface with rectification, filtering, and voltage regulation stages, along with a unidirectional current-blocking circuit to prevent reverse current flow during reverse vehicle operation. Additional modules include temperature sensing, wireless communication, and firmware-based logic for autonomous role switching, fault detection, and operational data logging. This architecture enables next-generation EV platforms to operate continuously under motion, potentially reducing or eliminating the need for external charging in specific applications.

(57) Abstract :

The invention discloses an intelligent and modular framework titled Enhanced Cloud Security Architecture for Data Protection, designed to address critical security challenges in dynamic cloud computing environments. This architecture integrates advanced cryptographic methods, AI-driven threat detection, Zero Trust enforcement and blockchain-based auditability to ensure the confidentiality, integrity and availability of data across public, private and hybrid cloud platforms. The proposed system begins with real-time data ingestion from diverse sources, including user activity logs, system events and multi-cloud APIs. Data is normalized, classified and encrypted using advanced schemes such as homomorphic and quantum-resilient encryption. Deep learning models analyze behavioral and operational data to detect anomalies and assign dynamic risk scores. These insights drive automated enforcement of context-aware access policies based on user identity, workload sensitivity, device posture and environmental factors. A key innovation of the architecture is its integration of Zero Trust principles, ensuring continuous verification and micro-segmentation to prevent unauthorized access and lateral movement. The architecture also incorporates a security orchestration engine capable of initiating automated remediation workflows in response to identified threats. Compliance with global data protection standards is achieved through embedded monitoring and a real-time dashboard that maps activities to regulatory benchmarks. Blockchain-based logging ensures tamper-evident recording of all access and policy enforcement events, supporting transparency and forensic analysis. This invention represents a significant advancement in cloud security, providing organizations with a scalable, proactive and resilient defense mechanism that evolves with emerging threats and operational demands.

## (57) Abstract :

An active exhaust management system for preventing water entry in two-wheeler silencer is described herein. The system comprises an exhaust silencer (10), a main shell (20), a valve sheet (30), a water measuring sensor (40), an elevated bypass exhaust pipe (50), a drainage water outlet pipe (60), a ball valve (70), a servo motor (80), a microcontroller (90), a battery (100), a top cover (110). This invention is ideal for urban commuters, off-road riders, and delivery services, ensuring smooth operation in challenging weather. The design prolongs silencer life and maintains engine efficiency across various environments.

## (57) Abstract :

A Real-Time AI System for Cyber Law Violation Forecasting and Adaptive Prevention is proposed in the invention. It is intended to anticipate possible infractions of cyber security rules and regulations and to instantly apply adaptive mitigation techniques. Natural language processing (NLP), sophisticated machine learning algorithms, and legal knowledge databases are all integrated into the system to track online activity, identify trends, and identify new cyber threats that could result in legal violations. Through the use of predictive algorithms, the system anticipates possible infractions based on past performance, court rulings, and ongoing cyber activity, allowing for preventative measures. This cutting-edge system continuously analyses network traffic, digital communications, and user behavior using artificial intelligence (AI) to spot indications of illegal activity, including data breaches, cyber fraud, intellectual property theft, and non-compliance with privacy laws. The system's real-time features, which include alert creation, policy enforcement, and dynamic access control modifications, guarantee that any discovered or anticipated infractions are promptly addressed. The system can modify its detection and prevention tactics in response to the changing cyber security legislation, guaranteeing adherence to regional, national, and global legal frameworks. The real-time AI system is a vital tool for risk management departments, legal teams, and cyber security operations since it enables organizations to improve data protection efforts, lower legal risks, and comply with regulations without the need for manual intervention. By combining artificial intelligence (AI) with legal compliance monitoring, this system significantly advances cyber security law enforcement by offering a fresh and all-encompassing approach to stopping cyber law violations before they happen and minimizing possible legal repercussions in a constantly changing cyber environment.

(57) Abstract :

**ABSTRACT A BAR MAKING DEVICE** The bar-making device (100) processes crushed food into compact bars. The bar making device comprises a press mould section (110). The press mould section (110) is cuboidal shaped with two openings—one for depositing crushed food and another for accessing the tray (116) at the bottom. A mechanical press (202), connected via a crank system, ascends and descends using a spur gear and rack gear system to compress food. The filler section (102) contains multiple openings, including one on top for depositing a sugar component. Several holes facilitate distribution. The heater system (104) attaches to the filler section, transferring heat through an inner wall to convert sugar into liquid syrup. This integrated system ensures efficient food compression and sugar infusion, aiding in uniform bar production.

(57) Abstract :

ABSTRACT AN IOT BASED REMOTE-CONTROL SYSTEM WITH WEB AND LOCAL INTERFACE FOR LEGACY INFRARED BASED APPLIANCES The invention discloses An IoT based Remote Control System (100) for enabling wireless control of legacy infrared (IR) based appliances (2). The system comprises a Wi-Fi-enabled microcontroller unit (MCU) (5), an IR receiver (6) for capturing signals from conventional remotes, and an IR transmitter (7) for replaying those signals to appliances. A DHT22 temperature and humidity sensor (8) enables environmental monitoring, while an OLED display (5) and tactile push buttons (6) provide a local user interface. The system is remotely accessible via a web-based interface (4), which communicates through an HTTP server (9) and an MQTT server (10). The module operates in a learning mode to store IR command patterns and a control mode to transmit them on user request. Environmental data and control signals are synchronized in real time, bridging non-IoT appliances with modern IoT infrastructure. The invention offers a compact, cost-effective retrofit solution without modifying existing appliances. [to be published with fig.1]

(57) Abstract :  
ABSTRACT SMART SHOE WITH INTEGRATED CAMERA SYSTEM AND REAL-TIME ROAD SURFACE ANALYSIS FOR PEDESTRIAN FALL PREVENTION The present invention relates to a smart shoe that enhances pedestrian safety by detecting and analyzing road surface hazards in real time. The system integrates a high-resolution wide-angle camera with night vision and HDR, an Inertial Measurement Unit (IMU), optional LIDAR for depth sensing, and GPS for location-specific hazard alerts. A low-power STM32 microcontroller processes images using deep learning algorithms, including Convolutional Neural Networks (CNN) and segmentation models like UNET, to classify surface irregularities and assess fall risks. A feedback system provides haptic and auditory alerts based on hazard severity. The shoe operates efficiently with an 8-hour battery, employing burst-mode image capture to conserve power. Designed for durability, it functions in various environments and can be customized for different user needs, including the elderly and visually impaired. This self-contained system requires minimal user interaction, offering a proactive solution for safer walking experiences. (To be published with Figure 1)

(57) Abstract :

The present invention relates to a regenerative Organic Rankine Cycle (ORC) system with two turbines arranged in series, designed to achieve a realistic thermal efficiency of 32-39% with a heat source of 300°C and a heat sink of 30°C. The invention uses organic fluid p-xylene, toluene, or cyclohexane due to its critical temperature proximity to the heat source (280-350°C), enhancing heat transfer and turbine performance. A regenerator preheats the fluid post-pump using exhaust heat from the second turbine, reducing the external heat input and boosting efficiency. The evaporator heats the fluid to a saturated vapor at 290°C using a 300°C heat source, maintaining a 10°C pinch point. The dual-turbine design splits the expansion process into two stages, high-to-intermediate pressure and intermediate-to-low pressure, to optimize work extraction under practical turbine (85%) and pump (80%) efficiencies. (57) Abstract :

A Novel Process of L-leucine-PLGA Conjugated, Hybrid Solid Lipid Nanoparticles (Conj-HSLNs) for Targeted Delivery of Betulin The present invention introduces a novel approach for fabrication of hybrid solid lipid nanoparticles (HSLN), which enhances the solubility and bioavailability of poorly water-soluble betulin.

Furthermore, the use of L-leucine-PLGA conjugate in HSLN fabrication instead of PLGA forms Conj-HSLN, allows targeted delivery through the L-amino acid transporter system to triple-negative breast cancer, increasing drug accumulation at the tumor site and provide controlled release, reducing the frequency of dosing and improving patient compliance. Furthermore, the nanoparticles were formulated using betulin, PLGA (or L-leucine-PLGA conjugate), Compritol ATO 888, and Poloxamer 188 through ultra probe sonication a hot high-pressure homogenization technique. The optimized formulation (Conj-HSLN) demonstrated a high yield (80–88%), favorable particle size (~318 nm), enhanced drug release, improved pharmacokinetics, and increased tumor accumulation LAT1 targeting. In overall this method offers a scalable, stable, and promising platform for the intravenous administration of poorly water-soluble anticancer agents.

(57) Abstract :  
Educational Board Game System Based on Prime and Composite Number Logic Abstract The present invention relates to an educational board game system for enhancing number theory skills, particularly prime and composite number identification and comprises a set of seventy-six (76) cards including number cards (categorized by prime and composite numbers), SKIP cards, and MAGIC cards. A game board with sixty numbered squares arranged in seven rows is provided. Cards are placed according to prime factorization rules: a number card can only be played if it is a prime or shares a common factor with the previously played card. MAGIC cards act as wildcard primes; SKIP cards force the next player to miss a turn. The game is initiated with a fixed '1' card and supports 2 to 6 players.

(57) Abstract :  
ABSTRACT SYSTEM AND METHOD FOR ADVANCED SIGNAL FILTERING The present disclosure describes a signal processing system (100) for filtering a multi-dimensional signal generated from an input source (102). The system (100) comprises a signal acquisition unit configured to sense at least one physical parameter of the multi-dimensional signal, at least one analog-to-digital converter (106) communicably coupled to the signal acquisition unit (104) and configured to: receive the at least one sensed physical parameter and generate a sampled discrete multi-dimensional data for the at least one received physical parameter. Further, the system (100) comprises a control unit (108) communicably coupled to the at least one analog-to-digital converter (106), wherein the control unit (108) is configured to perform an adaptive distance-weighted filtering on the sampled discrete multi-dimensional data to generate at least one filter value. Furthermore, the system (100) comprises an output interface (110) communicably coupled to the control unit (108). FIG. 1

(57) Abstract :

The present invention relates to a modular magnetometer apparatus (100) for optically detected magnetic resonance measurements using nitrogen-vacancy centers in diamond. The apparatus (100) comprises a miniature optical bench (102) supporting and aligning a plurality of optomechanical components, including a fiber-coupled 532 nm laser source (106) and a fiber-port (104) for collimating the laser beam. A dichroic mirror (108) reflects the laser toward the diamond sample (126) and transmits red photoluminescence. A microscope objective (110), long-pass filter (112), and photodiode (116) are aligned for collecting and detecting the photoluminescence signal. A data acquisition system (118) digitizes the signal. A signal generator (120) and amplifier drive a microwave signal to a printed circuit board (122) holding the diamond sample (126), while electromagnetic coils (124) apply a controlled magnetic field. The configuration of the apparatus (100) ensures accessibility, realignment, and adaptability for research, education, and training in quantum sensing applications.

## (57) Abstract :

Adaptive adhesive joint fixture system is described herein. The system comprises a base plate (10), a base support (20), a toggle clamp with an adjustable holder (30), a base plate (40) for the toggle clamp (30), a support for a testing component (50), a fixed holder with a base plate (60), a fixed holder with a side plate (70), a fixed holder with a top plate (80), a support for the fixed holder (90), and a plurality of hex head nut (100). The toggle clamp with an adjustable holder (30) holds a workpiece or component in position for testing or processing. The toggle clamp with an adjustable holder (30) adjusted to accommodate objects of varying sizes.

(57) Abstract :  
According to the present disclosure, an internet of things-based eddy covariance (IoT-EC) monitoring system is disclosed. The system measures turbulent fluxes of heat, mass, and momentum across diverse environments and provides critical observations to assess land-surface feedback and improves land-surface modelling in climate systems. The system comprises a telescopic mast (1) fixed and anchored to a wall (2), a plurality of sensor mounting brackets (4) integrally positioned into the telescopic mast (1), a plurality of sensors and a plurality of IoT enabled sensor nodes (7) mounted on the plurality of sensor mounting brackets (4), and a computing device (8) communicably connected to the plurality of sensors via a communication network. Further, the sensor nodes comprise a plurality of IoT-enabled microcontrollers to facilitate wireless data acquisition, remote updates, and real-time monitoring of eddy covariance. (57) Abstract :

The present invention relates to an advanced English language learning system that utilizes cognitive profiling, AI-driven personalized learning, and neuroscience-based techniques to enhance language acquisition. The system dynamically adapts lessons based on individual cognitive strengths, providing an optimized, engaging, and effective language learning experience.

(57) Abstract :  
ABSTRACT: Title: System for determining speed of underwater ultrasound using fuzzy-based machine learning and method thereof The present invention relates to a system for determining speed of underwater ultrasound using fuzzy-based machine learning, comprising: a data collection unit (10) comprises an ultrasound transducer configured to generate and receive ultrasonic pulses in water for measuring the speed of sound and temperature, a vibration sensor configured to measure ultrasonic temperature in pulse-echo mode, an environmental sensor configured to measure pressure and salinity, which influence sound speed, and data acquisition unit configured to record ultrasonic echo data, temperature, pressure, and salinity measurements, and a feature selection unit (30)configured to apply grey wolf optimization (GWO) to select the impactful features consists of temperature, pressure, and salinity, reducing dimensionality and improving model efficiency. Advantageously, the present invention provides human-understandable reasoning through linguistic variables and rule-based inference, facilitating better understanding, trust, and decision-making for users and operators. (57) Abstract :

This invention discloses a methotrexate-loaded nanogel optimized for topical delivery using a Box-Behnken Design (BBD). Formulated with HPMC K15, Carbopol 934, and Tween 80, the nanogel achieves a particle size of 123.74 nm, drug content of 96.45%, and sustained drug release of 91.15% over 12 hours. The emulsification-diffusion method ensures uniform nanodispersion, while pH adjustment to 7.0 enhances skin compatibility. The optimized formulation (F16) exhibits a zeta potential of -41.85 mV, entrapment efficiency of 76.65%, and spherical morphology confirmed by SEM. XRD analysis indicates partial amorphization of methotrexate, improving solubility. The nanogel follows the Higuchi model for diffusion-controlled release, offering superior stability and efficacy compared to conventional formulations. This invention provides a promising transdermal delivery system for managing psoriasis and rheumatoid arthritis, reducing systemic toxicity and enhancing patient compliance.To be signed by the authorized registered patent agent.

(57) Abstract :  
The present invention relates to acellular geosynthetic clay liner (GCL)(100) that enhances environmental protection and containment efficiency. The method involves the constructing a vertical element using three layers of geogrid or geonet with reduced effective aperture size for enhanced structural integrity, and connecting the vertical element to the base geogrid-geotextile-geogrid layer and top geogrid layer; and then connecting top geotextile (down) and geogrid (up) layers with entire system of top geogrid layer, vertical element and base layer using loops of monofilament wires. Finally, the sand-bentonite mixture is filled in the cells though the cut (401) made in top geotextile. The said innovative approach ensures the cellular geosynthetic clay liners (GCL) are robust and adaptable to various environmental conditions, promoting effective water management and sustainable practices in waste containment applications. (57) Abstract :

Multilingual Smart Pillbox with Audio-Visual Alerts based Reminder mechanism. This invention describes a multilingual, offline-enabled smart pillbox reminder system designed to improve medication adherence through time-based audio-visual alerts and manual intake confirmation. The system comprises a microcontroller-based control unit configured to execute scheduled medication reminders, illuminate corresponding compartment indicators, and deliver pre-recorded multilingual voice prompts. A user-actuated input mechanism enables confirmation of pill intake, which is logged in structured JSON format. The system further includes a rechargeable power supply with battery monitoring and a wireless communication interface to transmit adherence data to a cloud server when connectivity is available. A companion application allows remote caregivers to access real-time intake records, receive notifications for missed doses, and manage schedules. Operable without continuous internet or smartphone dependency, the invention provides an accessible, scalable, and cost-effective solution for enhancing patient compliance, particularly among the elderly and visually impaired. It is suited for deployment in domestic, rural, and institutional healthcare environments.

(57) Abstract :

An oral and facial hygiene system comprises of a base 101 having a set of storage chambers 102 to store oral and cleaning hygiene materials, a platform 103 with load cells to detect placement of a user's chin, a U-shaped frame 104 integrated with a motorized slider 105, a robotic gripper 106 mounted on the slider 105 to retrieve and position a flexible headband, a vertical rod 108 having a camera 109 integrated with NIR and LiDAR sensors for tracking the user's gaze and head position, a Geneva arrangement 110 including a motorized brush 112 mounted on one L-shaped link 111 incorporating a quick return arrangement and iris holes for dispensing oral care gel onto brush 112, a sponge pad 113 having dispensing holes for dispensing cleaning solution and water, a Peaucellier linkage arrangement 114 having a panel 115 and motorized clamps 116 to secure user's neck during hygiene tasks.

(57) Abstract :  
A light dome camouflage system for safeguarding infrastructure, comprises of a plurality of coherent near-infrared laser arrays 101 arranged to intersect in open air around a building to generate volumetric light voxels forming a three-dimensional light field projection to render the building optically merged with the surroundings, a panoramic high-resolution camera 102 to continuously scan the surrounding space for detecting unauthorized aerial hazards, an AI-based hazard detection module coupled with the camera 102 to analyze scanned data to distinguish non-civilian hazards from civilian aerial activity and trigger dome 103 activation upon detection of a hazard, an AI-controlled dynamic light modulation unit, utilizing Digital Light Processing (DLP) overlays to adapt the light field projection in real-time to environmental changes to maintain a high-fidelity optical camouflage, a control unit configured to synchronize the laser arrays 101, panoramic camera 102, and DLP overlays to generate a seamless 360-degree invisibility dome 103.

## (57) Abstract :

The present invention relates to a system and method for analyzing consumer behavior in e-commerce platforms to identify and influence factors affecting online purchase decisions. By integrating real-time interaction data, behavioral profiling, contextual analysis, and predictive modeling, the invention enables personalized user experiences and targeted marketing interventions. The system dynamically adapts to user intent, enhances product recommendations, reduces cart abandonment, and offers actionable insights for e-commerce operators, especially small and medium enterprises (SMEs), through a modular, scalable, and data-driven approach.

(57) Abstract :

A Polyherbal Pain Relief Patch Formulation The present invention introduces a synergistic Polyherbal pain relief patch formulation. Furthermore, combining traditional Polyherbal wisdom with modern transdermal drug delivery technology, this patch incorporates herbal extracts from medicinal plants like Berberis aristata, Curcuma longa, Tecomella undulata, Ricinus communis, Cinnamomum camphora, and Vitex negundo, known for their anti-inflammatory, analgesic, and tissue-repairing properties. In overall, it provides localized and sustained relief, offering a natural alternative to oral medications without systemic side effects. Non-invasive, mess-free, and easy to use, this patch is ideal for various users, including elderly individuals, athletes, and working professionals. The invention provides a holistic, cost-effective, and eco-conscious solution for pain management.

(57) Abstract :

Green Schottky Diode Using Marigold Flower Pigment-Sensitized TiO<sub>2</sub> Thin Films on ITO-PET Substrates This invention describes a method of developing Schottky diodes using natural pigments from marigold flowers as sensitizers and insulating layers on titanium dioxide (TiO<sub>2</sub>) semiconducting films. Waste marigold petals were processed to extract pigments, which were then deposited onto electrodeposited TiO<sub>2</sub> thin films on indium tin oxide–polyethylene terephthalate (ITO-PET) substrates. The TiO<sub>2</sub> films were prepared through a controlled ultrasonic-assisted electrodeposition method, ensuring homogeneity and stability. Optical and morphological properties of both the extract and the film were characterized using UV-VIS-NIR spectroscopy and SEM-EDAX analysis. The fabricated device demonstrated potential for optoelectronic and photovoltaic performance, supporting the use of bio-derived pigments in green electronics. This work emphasizes waste-to-wealth strategies aligned with green chemistry principles and aims to promote cost-effective, eco-friendly alternatives in organic semiconductor device development.

(57) Abstract :  
ABSTRACT Smart Hot Axle Box Detection and Cooling System using IoT The present invention relates to a Smart Hot Axle Box Detection and Cooling System designed for railway vehicles to prevent catastrophic axle failures caused by overheating. Utilizing a combination of non-contact infrared sensors, a microcontroller-based control unit, automated eco-friendly coolant dispensing, and real-time remote monitoring, this system offers a comprehensive solution to detect and manage excessive axle box temperatures. Upon detecting that a threshold temperature has been exceeded, the system autonomously triggers a cooling mechanism using a biodegradable ECO2 vegetable-based antifreeze solution and alerts nearby personnel through an audible buzzer. The system not only ensures mechanical safety and reliability in high-speed and freight trains but also enhances environmental sustainability and operational efficiency through real-time diagnostics and intelligent automation. (57) Abstract :

ABSTRACT The Novel Electric Vehicle Battery Charging System The present invention relates to a hybrid Electric Vehicle (EV) Battery Charging System designed to overcome the limitations of current EV charging infrastructure by offering a flexible, off-grid, and renewable energy-powered solution. Integrating advanced solar photovoltaic technology, intelligent control systems, and vehicle-to-vehicle (V2V) energy transfer capabilities, the system ensures efficient and sustainable charging even in remote or emergency conditions. Equipped with a boost converter, voltage regulators, real-time sensors, and an IoT-enabled microcontroller, the system provides optimized energy management, sun tracking, and remote diagnostics. This portable and intelligent charger enables users to charge EV batteries without dependence on traditional grid infrastructure, making it ideal for rural, highway, and disaster-affected environments. (57) Abstract :

ABSTRACT Fabrication of Solar-Wind Hybrid Power Plant The present invention relates to a hybrid renewable energy system that integrates solar and wind power generation to deliver a sustainable, efficient, and reliable electricity supply. The system combines photovoltaic (PV) solar panels and a vertical-axis wind turbine (VAWT), each harnessing renewable energy independently or simultaneously, depending on environmental conditions. It includes a hybrid charge controller, a battery bank for energy storage, and an inverter for converting DC to AC power. Designed to address the limitations of standalone solar or wind systems, this invention ensures consistent power output even under fluctuating weather patterns. It is particularly suitable for remote areas, rural electrification, and applications where grid access is limited or unavailable. The system provides a cost-effective, eco-friendly alternative to fossil fuel-based power generation, promoting energy independence and environmental sustainability. (57) Abstract :  
The present invention relates to an intelligent assistive device named VisionStick, designed to enhance the autonomy and safety of visually impaired individuals by integrating advanced technologies including speech recognition, natural language processing (NLP), real-time object detection, and ultrasonic sensing. The system is capable of functioning offline and supports multi-object recognition, obstacle detection, and voice-guided interaction. It bridges the gap between sight and touch by translating visual information into real-time auditory or tactile feedback, enabling users to navigate and interact with their environment independently. The VisionStick also includes safety features such as emergency alerts and hazard recognition, thereby addressing key challenges faced by the visually impaired in both familiar and unfamiliar settings. The invention emphasizes low-cost deployment, user-centric design, and adaptability, making it a viable solution for improving accessibility and quality of life for blind and visually impaired individuals. (57) Abstract :

**ABSTRACT** Fabrication of a Cradle-Based Water Lifting Mechanism The present invention relates to a mechanical water lifting system, more specifically to a manually or naturally actuated cradle-based mechanism that facilitates efficient and sustainable extraction of water from wells, ponds, or similar sources. The system utilizes a pivotally mounted cradle structure integrated with a reciprocating piston pump. Through a rocking motion actuated by the user or natural forces, the cradle converts oscillatory motion into vertical reciprocating movement, thereby driving the pump to lift water. A counterweight mechanism assists the cradle's movement, significantly reducing the physical effort required for operation. The invention is particularly suited for rural, off-grid, or economically constrained regions where access to powered pumping solutions is limited or non-existent. Designed for low-cost fabrication using locally available materials, the system presents a reliable, user-friendly, and environmentally sustainable solution for domestic, agricultural, and community-level water needs. (57) Abstract :  
ABSTRACT AGROVISION: A Data-Driven AI Solution for Precision Farming AgroVision is an AI-powered, precision agriculture platform designed to empower farmers with intelligent, data-driven insights for optimizing crop production and farm management. By integrating real-time environmental data, market analytics, weather forecasting, and personalized AI-generated crop recommendations, AgroVision enables farmers to make informed decisions, reduce agricultural risks, and improve overall productivity. The platform includes a multilingual AI chatbot for instant agricultural guidance, a dynamic crop calendar tailored to specific geographic and soil conditions, and a centralized farm management dashboard to track multi-plot operations. AgroVision offers a scalable, user-friendly digital ecosystem that bridges the gap between traditional farming practices and smart, sustainable agriculture through the power of artificial intelligence. ## (57) Abstract :

The present invention relates to a self-sustaining streetlight system that harnesses wind energy through a vertical axis wind turbine (100)(VAWT) integrated with a dynamic motor (101) acting as a generator. The invention provides an eco-friendly, off-grid lighting solution ideal for urban and remote areas. The VAWT captures wind from all directions, driving the motor to generate electrical energy, which is then rectified and stored in a rechargeable battery (104). A charge controller (103) ensures optimal charging conditions while an LED driver regulates power to energy-efficient LED lamps. The system is designed to operate reliably in variable wind conditions, ensuring continuous illumination even during low wind periods through battery support. [To be published along with Figure 1]

(57) Abstract :  
ABSTRACT An Interactive Driving Coach The present invention relates to an interactive driving assistant system for electric vehicles (EVs), termed Smart Guide, which introduces a human-like avatar named Aura for enhancing safety, personalization, and entertainment during EV operation. Smart Guide integrates real-time feedback mechanisms, safety alerts, infotainment modules, and multi-language support within a unified dashboard interface. The system features advanced functionalities including battery leakage alerts, fire detection with action timers, accident detection with automatic emergency call initiation, and driver behavior feedback. It supports English and Hindi for broader accessibility and includes additional features such as web browsing, music playback, in-car gaming, and charging station mapping. Developed on a modular software and hardware platform, Smart Guide aims to improve driving safety, user engagement, and overall EV experience, particularly for regions with multilingual user bases like India.

(57) Abstract :  
ABSTRACT Hands-free Mouse Control for Physically Challenged Users The present invention relates to a hands-free cursor control system designed specifically for individuals with limited or no hand mobility. The system enables intuitive and independent interaction with computers using facial gestures and head movements. Leveraging real-time facial landmark detection, gesture recognition, and head pose tracking, the invention translates natural facial cues—such as eye blinks, head tilts, mouth openings, and lip expansions—into precise cursor movements and mouse commands. The system eliminates the need for conventional input devices like a mouse or keyboard, promoting digital accessibility and inclusivity for users with physical disabilities. The design emphasizes simplicity, accuracy, and responsiveness, ensuring seamless integration into daily digital activities. [To be published along with Figure 1]

(57) Abstract :

**ABSTRACT WIRELESS ENLIGHTING LAMP** The present invention relates to a Wireless Enlightening of Candling System designed to modernize the traditional method of lighting candles or lamps by enabling wireless ignition and control. This system offers a contactless, safe, and intelligent solution for environments where manual lighting may be unsafe or inconvenient, such as in religious settings, smart homes, memorial events, and public installations. The system comprises a candle unit with an embedded ignition mechanism or flame-simulating LED, a wireless controller capable of transmitting activation signals via RF, Bluetooth, Wi-Fi, or IR, and an integrated microcontroller for receiving and executing commands. The invention enhances safety with features such as motion detection, overheat protection, and environmental sensing, while offering real-time feedback through audio alerts or visual indicators. This innovation enables remote operation, energy efficiency, and seamless integration with smart devices, thereby revolutionizing traditional candling practices. (57) Abstract :  
ABSTRACT A SYSTEM AND A METHOD TO PREDICT EARLY DIABETES AND GENERATE PERSONALIZED LIFESTYLE-BASED TREATMENT RECOMMENDATIONS USING MACHINE LEARNING The present disclosure relates to a system and method to accurately predict diabetes risk and provide personalized treatment recommendations using advanced machine learning techniques. The system collects comprehensive clinical and lifestyle data from patients, which is preprocessed through missing value imputation, feature normalization via MinMaxScaler, and feature selection using the chi-square statistical test. To address class imbalance in medical datasets, Synthetic Minority Oversampling Technique (SMOTE) is applied, improving model fairness and sensitivity. A Random Forest Classifier is trained on the balanced dataset and validated through stratified k-Fold cross-validation to ensure robust and generalizable predictions. Based on the predicted diabetes risk score, a treatment recommendation module generates tailored intervention plans using rule-based clinical guidelines and/or machine learning-driven decision models. The system emphasizes explainability by providing feature importance metrics, enhancing clinical trust. This integrated approach enables early detection and personalized diabetes management, overcoming limitations of conventional methods and facilitating improved patient outcomes. Fig. 3.

(57) Abstract :

A Bioactive Film Composition for Incorporation into Sanitary Pads The present invention discloses a bioactive film composition for integration into sanitary pads comprises of the film comprises of preferred ingredient Tridax procumbens extract (aqueous and/or ethanolic) taken with excipients Hydroxypropyl methylcellulose (HPMC), Polyvinyl alcohol (PVA), ethanol, PEG 400, Tween 80, tea tree oil, lavender oil, rose water, witch hazel, glycerin, citric acid, and distilled water, prepared via polymer dissolution, emulsification of essential oils, incorporation of plant extracts, and controlled drying to form a flexible film; laminated onto the absorbent core of sanitary pads and provides continuous topical release of bioactive agents to exhibit synergistic antifungal and antimicrobial activity against pathogens such as Candida albicans and Staphylococcus aureus, respectively along with skin-soothing and anti-inflammatory benefits and enhances menstrual hygiene, reduce infection risk, and improve user comfort using natural, biocompatible ingredients.

(57) Abstract :

The present invention provides a method and system for early detection of multiple types of cancer using medical images. The system employs a hybrid deep learning model that combines a convolutional neural network (CNN) for feature extraction and a long short-term memory (LSTM) network for sequential processing. The model is trained on a large dataset of medical images labeled with various cancer types, enabling it to accurately classify new images into different cancer categories or no cancer. The invention offers improved accuracy and efficiency in cancer detection, facilitating early diagnosis and treatment.

Address of Applicant :Flat no. 10, 4th floor, opposite Ramkrishna Chowk, Om heritage, Pimple Gurav, Pune, Maharashtra 411027 -----

(57) Abstract :

Abstract This study focuses on enhancing the performance of aqueous zinc-ion batteries. A newly developed cathode material—potassium-ion (K<sup>+</sup>) intercalated layered manganese dioxide (KMnO<sub>2</sub>)—will be a prominent solution for this study. Slow ion transport, structural breakdown, and limited energy capacity are the major issues that we face in traditional MnO<sub>2</sub> cathodes. To achieve greater structural integrity, increased active sites for electrochemical reactions, and smoother zinc-ion movement during charging and discharging, incorporating potassium ions into the layer of the MnO<sub>2</sub> structure is a prominent solution. The synthesis utilised a thermal decomposition technique, which is cost-effective and yields a well-structured cathode material with a high surface area. The material's composition and morphology are characterized by using XRD, SEM, EDS, and Raman spectroscopy. By electrochemical analysis, a high specific capacity of 264 mAh, robust rate performance, and excellent cycling stability were achieved. This developed cathode serves as a promising material for a sustainable, high-performance alternative for future to zinc-ion battery, aluminium-ion battery, and other metal-ion battery-based energy storage systems.
