(57) Abstract :

Cables can be vulnerable to a variety of risks and threats, depending on their location and installation type. Rodents are one of the leading causes of these dangers or attacks. Rodents can cause significant damage to cables by chewing or gnawing on their outer coating. The objective of the present invention is to develop an eco-friendly, rodent-repellent, and thermally resistant wire insulation material that replaces petroleum-based coatings, primarily used in automotive, electrical, and industrial wiring.

(57) Abstract :

The present invention relates to a dynamic, adaptive solar energy system designed to enhance energy conversion efficiency under varying environmental conditions. The system comprises a plurality of photovoltaic modules, a sensor array for real-time monitoring of environmental parameters such as solar irradiance, temperature, and wind speed, and a control unit integrated with an adaptive optimization module. This module dynamically adjusts operational parameters of the photovoltaic modules based on sensor inputs to maximize energy output. The invention addresses the limitations of conventional solar technologies by providing an intelligent, responsive solution that optimizes performance in fluctuating environments, thereby improving the overall reliability and efficiency of renewable energy generation.

(57) Abstract :

The present invention relates to the formulation of Nano - Cubosomes of Tebuconazole pesticide. The nanoformulations improves the solubility, thus reducing the toxicity, wherein Nano-Cubosomes acts as a carrier for Tebuconazole with neem oil as an emulsifying agent (lipid phase) and Tween 80 as a non-ionic surfactant. The developed Tebuconazole-loaded nano-cubosomes 10 have been evaluated for their various physio-chemical parameters such as globule size, zeta potential, compatibility, and thermal properties. The best-achieved nano. cubosomes (TF2) showed small mean particle size, good stability, and a maximum pesticide loading of 83.91%. TF2 (nann cubosomes of tebuconazole) highly control the pest with high degradability, thereby the soil and water pollution is reduced maximum in the

(57) Abstract :  
ABSTRACT Machine Learning based Anomaly detection and monitoring in Battery Energy Storage Systems The present invention discloses a machine learning-based system and method for real-time anomaly detection and monitoring in Battery Energy Storage Systems (BESS). The proposed system utilizes supervised learning techniques, particularly the XGBoost algorithm, to detect and classify various anomalies including power overlimits, power oscillations, state of charge (SOC) tampering, harmonic distortion, and voltage manipulation. The system architecture integrates a data acquisition module, MLbased detection engine, anomaly classification unit, visualization dashboard, and an alert notification mechanism compatible with SCADA and email systems. Designed for edge-level deployment, the system offers rapid decision-making capabilities, enhances BESS operational safety, mitigates cyberattacks such as false or bad data injection, and supports preventive maintenance through real-time monitoring and alerting.

(57) Abstract :

ABSTRACT: An equimolar mixture of 4-phenylthiazole-2-semicarbazide and 5-methylsalicylaldehyde in ethanol was refluxed in presence of catalytic amount of glacial acetic acid (1-2 drops) for about 6 h on a water bath. The reaction mixture was cooled to room temperature, the separated Schiff base was collected by filtration, dried and recrystallized from absolute ethanol. The ligand and its metal complexes were thoroughly characterized and evaluated for their antibacterial activity against Escherichia coli and Staphylococcus aureus, as well as for their antifungal activity against Aspergillus niger and Candida albicans. All metal complexes exhibited enhanced antimicrobial activity compared to the free ligand HL.

(57) Abstract :  
ABSTRACT This invention introduces a novel approach for analysing retrial queueing systems by combining a bi-level working breakdown deterioration mechanism with machine learning techniques. This invention addresses the limitations of existing queueing models, which often fail to capture the gradual progression of minor server issues into major breakdowns, a phenomenon observed in high-demand applications such as online consultation platforms and cloud computing systems. Many queueing models have been developed to explain system failures, but they often miss an important detail: some major breakdowns don't happen all at once. Instead, they begin as minor issues and gradually worsen over time. This gradual deterioration is common in areas like production lines, traffic systems, and communication networks. In this work, we introduce the concept of the working breakdown deterioration mechanism and investigate it through a bi-level working breakdown deterioration model. Queueing systems are crucial in many fields, where accurately predicting sojourn times is vital for improving operational efficiency and enhancing customer experiences. Machine learning is a powerful tool for analysing datasets by identifying patterns and relationships between variables. Through algorithms that can "learn" from data, machine learning enables us to make predictions, categorize information, and uncover insights that might not be evident through traditional methods. By training models on available data, we can detect trends, classify features, and even anticipate future behaviours of the variables involved. This approach allows for more accurate, data driven decision making in various fields, from finance to healthcare and engineering, etc. This invention presents a supervised machine learning framework aimed at predicting sojourn times in queueing systems. Furthermore, machine learning serves as a valuable tool for verifying the accuracy of existing sojourn time formula.

(57) Abstract :  
ABSTRACT OF THE INVENTION TITLE: TRACKBOT: OBJECT TRACKING ROBOT FOR WAREHOUSE AND RETAIL SYSTEM: The current invention deals with 'automatic tracking' of an object in a dynamic indoor environment. It is like warehouses and retail spaces. The solution for this is a mobile-robot car ... : called TrackBot, integrated with a ESP32-CAM video processing, ultrasonic and infrared sensors, ESP32 micro-controller for the intelligent control. TrackBot constantly grabs video frames for a specified object tracking with built-in computer vision algorithms. Proximity sensors help maintain environment perception and the capabilities to detect and escape from the obstacles. A motor driver module decodes commands from the processor and actuates the motors on the robot. The robot is powered by a rechargeable battery pack for unhindered movement. The current invention provides a scalable standalone system that is inexpensive to produce in place of fixed tracking devices, therefore resulting in greater operational efficiencies, reduced labor and higher visibility of inventory. Its modular design allows for future upgrades, like QR code reading technology and AI-based predictive behavior and offers an adaptable solution for today's logistics and retail automation applications.

(57) Abstract :

ABSTRACT OF THE INVENTION An Automatic Sewage Monitoring and Controlling System Using IoT and Blockchain The rapid growth of urban populations has increased the strain on infrastructure, particularly sewage systems, leading to health hazards caused by improper drainage and poorly maintained manhole covers. To address this, the invention proposes an autonomous sewage monitoring and I O controlling system that integrates Internet of Things (IoT) and blockchain technologies. The system monitors key sewage parameters such as water level, temperature, gas emissions, and manhole cover status in real time using various sensors. A web/mobile-based interface equipped with GPS mapping enables ~o~sers to pinpoint maintenance locations and visualize sewage conditions. The sensed data is transmitted to the cloud via IoT modules, hashed for security, and 15 stored on a blockchain platform to ensure data integrity and tamper resistance. This enables 20 authorized stakeholders, such as municipal authorities and urban planners, to access reliable, real-time information and respond promptly to hazardous ·conditions. The proposed. system minimizes manual intervention, enhances operational efficiency, and supports the goals of public health and sanitation outlined in the Sustainable Development Goals.

(57) Abstract :

ABSTRACT Urinary tract infections (UTIs) are among the most prevalent bacterial infections, often aggravated by urease-producing pathogens . These urease enzymes contribute to infection severity by alkalinizing the urine, leading to crystal and stone formation. The growing resistance to conventional antibiotics underscores the urgent need for novel, natural therapeutic agents. This study explores protocatechuic acid (PCA), a phenolic compound isolated from Phyllanthus emblica (Indian gooseberry), for its potential inhibitory action against urease enzymes linked to UTIs. The research comprises a comprehensive bioactive profiling of P. emblica extracts using chromatographic and spectrometric techniques to isolate and identify PCA. The isolated compound was subjected to in silico molecular docking studies against urease enzymes (PDB ID: 3LA4 and 1 E9Y), revealing strong binding affinities

(57) Abstract :

ABSTRACT ILLUMINOUS DISTAL END CUTTER FOR CUTTING DISTAL END OF ARCHWIRE A single manual instrument designed for cutting the distal end of arch wires in orthodontic procedures, incorporating an integrated light source positioned at the distal end to enhance visibility during operation. The instrument is non-engine driven and is primarily used in the oral cavity to provide precise and efficient wire cutting. The handle is designed ergonomically with a plurality of varied serrations to ensure a secure grip and prevent slippage during use. The instrument includes a durable cutting edge to effectively cut arch wires, while the integrated light source improves visibility, ensuring safety and reducing the risk of injury to the patient's oral structures and mucosa. :The light source is powered by a reliable power source, providing consistent illumination throughout the cutting process. The instrument is designed for use with both upper and lower arch wires, ensuring optimal access and force application for effective cutting

(57) Abstract :  
ABSTRACT TITLE: EXPLORING THE BIODEGRADATION POTENTIAL OF SOIL MICROBES FOR PLASTIC WASTE MANAGEMENT VIA ENZYME PRODUCTION Plastic pollution poses a significant environmental challenge due to its persistence and resistance to natural degradation. Microbial enzymes offer a promising ecofriendly solution for plastic waste management. This study focuses on the isolation and characterization of soil microbes capable of producing alkane hydroxylase-an enzyme known for its role in the degradation of hydrocarbon chains found in polyethylene and other plastics. Molecular identification and enzyme assays confirmed the presence and activity of alkane hydroxylase. The enzyme activity was optimized under different pH, temperature, and substrate conditions to determine its Efficiency. This study highlights the potential of harnessing native soil microbes for biotechnological applications in plastic biodegradation and paves the way for the development of sustainable waste management strategies.

(57) Abstract :  
ABSTRACT OF THE INVENTION Title:. Iot -Based Smart Emergency Alert System· The current innovation offers an learned of Things (Iot)-Based Smart Emergency Alert System than an automatically .identify accidents .o r significant impact events and communicate. ex. act GPS location coordinates and real-time emergency notifications via GSM to designated contacts. A motion and orientation sensor (MP\6050), a GPS, module· for real-time, tracking, and a GSM SIM808 module for SMS and call-based alerts are all included into the system, which is based on · the Arduino Uno microcontroller platform: .In order to ensure that emergency notifications can be . . . activated both automatically and manually, the invention also incorporates a manual emergency· activation push-button, a 16x2 LCD for system status display, and a buzzer for auditory alerting. Students, employees; the elderly;. and commuters can all benefit from the device:·s. power . efficiency, portability, and versatility for usage in cars; wearable devices, helmet~, and stand~lone safety kits. The technology guarantees prompt assistance in emergency situations by analysing . . data in real-time, minimizing false positives, and communicating quickly. Figure upgrade features· like cloud data integration, AI-based fall detection, and hands-free voice activation are also . supported by the design, providing a scalable, dependable, and vital life-saving tool for smart safety infrastr1Jcture in both urban and rural Settings

(57) Abstract :  
ABSTRACT OF THE INVENTION ~his BusMate app is a comprehensive platform for real-time bus tracking and emergency management. The system integrates user, driver, and administrative roles with a robust technology stack. Users can access their location, track the bus, and initiate emergency alerts to first responders. Drivers contribute by continuously updating bus positions. Administrators oversee bus information and driver credentials. A React-based frontend provides an intuitive user interface, while MongoDB stores critical data. Express serves as the backend, facilitating data interaction. OpenStreet Map and OpenCage APIs power map visualization and geocoding. This innovative solution enhances passenger safety and operational efficiency in public transportation systems by providing essential location-based services and emergency response capabilities.

(57) Abstract :  
Abstract The Dental Care App is a comprehensive mobile application designed to enhance oral hygiene and dental health through smart tracking, personalized reminders, educational content, virtual consultations, and AI-based diagnostic assistance. The app leverages mobile technology and AI to promote daily dental care routines, early diagnosis of oral issues, and better communication between users and dental professionals.

(57) Abstract :

**ABSTRACT:** The present invention relates to a modified cyanoacrylate adhesive (CyaBond-3D) specifically developed for bonding 3D-printed denture bases and 3D-printed teeth. This adhesive addresses the limitations of conventional bonding agents by offering enhanced shear bond strength, improved longevity, and superior biocompatibility, making it particularly suitable for prosthodontic applications. The formulation of CyaBond-3D comprises a unique combination of n-butyl cyanoacrylate, iso-amyl cyanoacrylate, and denture 3D printing resin, synergistically engineered to optimize adhesion, polymerization kinetics, and resistance to intraoral conditions. The presence of iso-amyl cyanoacrylate contributes to increased flexibility and toughness, reducing brittleness commonly observed in traditional cyanoacrylate adhesives. The incorporation of 3D printing resin enhances compatibility with additively manufactured denture materials, ensuring a strong chemical bond with photopolymerized resins. The invention provides a reliable, cost-effective, and scalable solution for the growing market of 3D-printed dental prostheses, facilitating strong, durable, and esthetically acceptable denture restorations

(57) Abstract :

The invention relates to the field of restorative and esthetic dentistry, specifically to matrix systems E used for direct composite restorations of anterior teeth. The Polycontoura Anterior Contouring and £ Polishing Two-in-One Matrix System is designed to aid dental professionals in achieving precise 2 anatomical contouring and smooth finishing of composite restorations in a single step. This o innovation enhances the efficiency and accuracy of anterior restorations by integrating contouring o and finishing functions into a single matrix system, reducing the need for additional finishing J procedures and improving esthetic outcomes.

(57) Abstract :

ABSTRACT Maxillomandibular reconstruction is often complex and often needs the use of distant bone grafts or bone flaps for reconstruction. These procedures are often morbid and require the second donor site . To overcome the same, recent advances including transport Distraction osteogenesis, stem cell therapy and patient specific implants are gaining importance. Stem cell therapy in Maxillofacial reconstruction is in its infancy and has been reported in very few case series. Whereas patient specific implants are not often the first option of reconstruction considering it to be an non autogenous - prosthetic replacement. Transport distraction osteogenesis involves the creation and transportation of a bone segment from one side of the alveolus across the defect to to the contralateral - recipient side alveolus to facilitate reconstruction of the dentoalveolar maxilla / Mandible defect . Though the concept of distraction osteogenesis was introduced in Maxillofacial surgery in the 1990, limitations with the use of bulkier devices, transports across the curved arch have been the challenges that have restricted their use in the field of Maxillofacial surgery. The objective of the current invention is to design a hybrid bifocal / Trifocals transport Distraction device for the maxillary alveolus that will facilitate bone regeneration in the region of maxillary alveolus secondary to congenital/ acquired maxillary dentoalveolar defects

(57) Abstract :  
ABSTRACT This invention introduces an artificial intelligence (AI)-based system designed to detect and replicate natural eye blinking for use in bionic eye prostheses. The technology utilizes a smartphone or smart eyewear camera to capture real-time video of the user’s natural eye. Through computer vision and deep learning algorithms, the system accurately identifies blink patterns, distinguishing them from other facial expressions or movements. Upon detecting a blink, the system wirelessly transmits a signal to the prosthetic eye, triggering a synchronized blink response. This process ensures natural coordination between the user’s biological and prosthetic eye, significantly enhancing the aesthetic and emotional impact of ocular prostheses. The system has the potential to improve psychological well-being, user confidence, and overall quality of life by bridging the gap between passive and functional prosthetic eyes.

(57) Abstract :

Abstract This study investigated the antimicrobial, anti-biofilm, antioxidant, and antiinflammatory properties of Amphiroa fragilissima methanolic extracts. The sample underwent homogenization, centrifugation, and magnetic stirring to ensure effective extraction. Antioxidant activity was assessed using the DPPH assay, antimicrobial effects were tested against Streptococcus mutans, Escherichia coli, Enterococcus faecalis, and Shigella sonnei via the Kirby-Bauer disk diffusion method, and biofilm inhibition was evaluated against the same organisms. Anti-inflammatory activity was determined using a modified BSA assay. The extract showed notable antimicrobial activity, with inhibition zones increasing in size with concentration and reaching a maximum of 16±0.1 mm at 100pg/mL. It also effectively inhibited biofilm formation in a dose-dependent manner. Antioxidant activity increased from 10pg/mL to a peak at 40 pg/mL before declining at 50 pg/mL. Additionally, the extract inhibited BSA denaturation, indicating promising anti-inflammatory effects. These findings suggest that A. fragilissima is a potent natural source of therapeutic compounds with potential applications in dentistry.

(57) Abstract :

This study evaluated the antimicrobial, anti-biofilm, antioxidant, and antiinflammatory properties of Halimeda ^rac/7/smethanolic extracts. The sample was processed through homogenization, centrifugation, and magnetic stirring to ensure efficient extraction. Antioxidant activity was assessed using the DPPH assay, antimicrobial effects were tested against Streptococcus mutans, Escherichia coli, Enterococcus faecalis, and Shigella sonnei using the Kirby-Bauer disk diffusion method, biofilm inhibition was measured against the same organisms, and antiinflammatory activity was determined using a modified BSA assay. The extract demonstrated effective antimicrobial activity, with the zone of inhibition increasing with concentration, peaking at 17 ±0.1 mm at 100pg/mL. It also significantly inhibited biofilm formation in a dose-dependent manner. Antioxidant activity rose with concentration up to 40 pg/mL before declining at 50 pg/mL. The extract effectively inhibited BSA denaturation, indicating promising anti-inflammatory potential. These findings suggest H. gracilis as a promising natural source of bioactive compounds with potential applications in dental therapeutics.

(57) Abstract :  
Abstract The invention relates to an oral hygiene device—specifically, an interdental brush with a detachable and replaceable head. The design improves hygiene, extends the product’s lifespan, and promotes sustainability by allowing users to retain the handle while replacing only the worn-out brush head. The invention also supports customizable brush head sizes to suit different interdental spaces.

(57) Abstract :  
Abstract The present invention relates to a dental diagnostic tool—specifically, a mouth mirror integrated with an LED light source. This improved device enhances intraoral visibility during examinations and minor procedures, particularly in low-light conditions or in areas of the mouth that are otherwise difficult to observe. The integration of the LED ensures better illumination, reduces dependency on external light sources, and increases diagnostic accuracy and convenience for dental practitioners.

(57) Abstract :

Due to the anatomical complexity of the root canal system, successful endodontic treatment requires a combination of mechanical and chemical preparation to remove infected tissue and achieve effective disinfection of the root canals. To date, sodium hypochlorite (NaOCl) remains the preferred chemical irrigant due to its broad-spectrum antibacterial properties against species involved in endodontic infection. NaOCl concentrations ranging from 0.5 to 6% are used in endodontic treatment. To ensure efficacy at lower concentrations, Pre-heating NaOCl allows faster tissue dissolution coupled with enhanced antibacterial properties without affecting its short-term stability. Heating NaOCl extra-orally to 70 °C was found to result in an intracanal irrigant temperature increase to 44 ±2.5 °C. Different studies have used various methods to achieve thermal activation of the irrigants such as bottle warmer, preheated syringes, laser energy, and so on. This invention fills a crucial gap in the dental industry by introducing a dedicated sodium hypochlorite warming device designed specifically for endodontic use.

(57) Abstract :  
Abstract DentalSolutions is an innovative mobile application designed to enhance the efficiency of dental care through AI-powered image analysis, seamless communication, and advanced patient management. The application integrates cross sectional CBCT imaging for precise dental assessments and employs deep learning models to predict gingival thickness using CNN (convolutional neural networks) regression, assisting dentists in their evaluations. It features secure real-time communication via WhatsApp, enabling direct interaction between patients and dentists. Additionally, the platform provides image-based predictions and related details, ensuring an intuitive and efficient workflow for dental professionals.

(57) Abstract :

ABSTRACT Herein, we report the synthesis of a new potassium-tin metal-organic framework (K-Sn-MOF) with a three-dimensional non-interpenetrated architecture via a hydrothermal method using a DMF/ethanol solvent mixture and water-yielding phase-pure hexagonal prismatic crystals (50-200 J.UTI) with a 75% yield. Single-crystal X-ray diffraction (SC-XRD) analysis confirmed a trigonal crystal system with a Cmc<sub>2</sub> space group, revealing a robust heterometallic Sn-K-Cl coordination network that overcomes the stability limitations of conventional tin-based MOFs. Additionally, FT-IR and P-XRD analyses provide further support for the structural integrity and functionality of the MOF. Additionally, N<sub>2</sub> isotherm analysis provided a BET surface area of 25.5 m<sup>2</sup>/g, along with a pore diameter of approximately 14.5 Å. Thermogravimetric analysis (TGA) demonstrated enhanced thermal stability up to 450 °C, attributed to chloride-mediated [K-Cl-K] clusters. Furthermore, K-Sn-MOF demonstrated exceptional performance in three three-electrode systems with 3M KOH as the electrolyte. Cyclic Voltammetry (CV) and galvanostatic charge/discharge (GCD) studies were performed. The GCD data revealed a specific capacitance (C<sub>s</sub>) of 1021.9 F/g at 1 A/g, surpassing the capacitances of most reported pristine MOFs. These results show that when alkaline metals are incorporated into the MOF network, both the structural stability and MOF conductivity can be improved. Therefore, in this study, we bridged the gap between conventional MOFs with limited conductivity and their application in energy storage by structural integration and the excellent electrochemical behavior of K-Sn-MOF, thereby offering a promising solution. for sustainable energy storage and environmental remediation applications.

(57) Abstract :  
ABSTRACT The novel invention for fungal isolation is the Piston Driven Myco-tweezer, a newly developed tool, made up of stainless steel designed to significantly enhance the precision and accuracy of fungal structure isolation. This innovative tool combines a precision-engineered tweezer with a hollow cylindrical handle fitted with a T -probe needle, operating through a controlled piston-driven mechanism. The Piston Driven Myco-tweezer is specifically designed to minimize cross-contamination, reduce fungal structure damage, and optimize isolation across various culture methods. Traditional fungal isolation techniques often face challenges such as organismal disruption and sample contamination, leading to compromised results. The Piston Driven Myco-tweezer addresses these issues by allowing controlled, stable, and minimal-contact manipulation of delicate fungal structures. The tweezer provides superior grip and stability due to its anti-slip design, while the piston mechanism of the Tprobe needle enables precise forward, backward, and rotational movement. By offering a specific and specialized tool for mycelial isolation, the Piston Driven Myco-tweezer represents a major step forward in clinical mycology, research laboratories, and industries where microbial precision is essential. Its ergonomic design, material durability, and unique movement control significantly improve the reliability and reproducibility of fungal isolation outcomes.

(57) Abstract :  
ABSTRACT Antimicrobial Susceptibility' Testing (AST) is an essential laboratory technique used to evaluate bacterial resistance to antibiotics, guiding effective treatment decisions and combating antimicrobial resistance. Traditional methods for measuring the zone of inhibition (ZOI) in disk diffusion tests often suffer from human error, time inefficiencies, and lack of standardization. To address these challenges, we have developed an innovative petriplate with pre-marked measurement lines, offering an accurate, efficient, and standardized approach to ZOI measurement. This novel petriplate features pre-defined measurement rings at fixed intervals, allowing for quick visual assessment without the need for additional tools such as rulers or calipers. The markings are designed with high contrast for better visibility and align with international AST guidelines, such as those from CLSI and EUCAST. The product is made from highquality, sterilizable plastic, ensuring durability and contamination prevention. Compared to conventional measurement methods, this pre-marked petriplate offers enhanced accuracy, improved efficiency, and cost-effectiveness, making it particularly valuable for clinical laboratories, pharmaceutical research, veterinary microbiology, and educational institutions. It significantly reduces inter-user variability, expedites laboratory workflows, and aids in precise susceptibility classification, thereby supporting better antibiotic stewardship. This innovation has broad applications in clinical microbiology, antimicrobial resistance surveillance, drug development, and training. Future enhancements may include integration with digital imaging, customizable marking designs, and eco-friendly materials to further improve usability and sustainability. By addressing critical limitations in traditional AST techniques, this pre-marked petri plate has the potential to revolutionize microbial diagnostics, ensuring more reliable, efficient, and accessible antimicrobial susceptibility testing across various laboratory settings.

(57) Abstract :

Abstract: The shift to bioplastics is becoming more and more important as worries about plastic pollution and its detrimental effects on the environment grow. Bioplastics, derived from renewable biological sources, offer a sustainable substitute for conventional petroleum-based plastics. Among these sources, blue-green algae Spirulina have attracted interest due to their valuable compounds and potential for bioplastic synthesis. This study examines the viability of utilizing Spirulina for two objectives: the extraction of phycocyanin and the production of bioplastics from the extracted biomass. Employing a standardized protocol, a concentration of 4.3 mg/L was obtained from the phycocyanin extraction process, while the remaining residues contained 40.13% carbohydrate with the polyhydric polyhydroxyalkanoates (PHA) quantified in the residual Spirulina, indicating their potential for biopolymer production thus rendering them an optimal feedstock for the biodegradable plastic production. The isolated PHA is then processed into bioplastic films through optimized techniques, ensuring sufficient mechanical strength, biodegradability and food safety for sustainable food packing applications. The integration of sustainable and environmentally friendly bioplastics, promoting waste valorization and advancing a circular bioeconomy.

(57) Abstract :

ABSTRACT: The present invention introduces a Virtual Orthodontic Treatment Simulator, a VRJAR-based platform that enables orthodontists and patients to visualize and simulate treatment progress and outcomes in real-time. This system incorporates interactive 3D models of teeth and jaws, allowing users to explore orthodontic treatment scenarios dynamically. By integrating predictive algorithms and AI-driven treatment simulation, the system provides an accurate representation of expected treatment progress. The platform enhances patient engagement, improves treatment planning accuracy, and optimizes communication between orthodontists and patients. The Virtual Orthodontic Treatment Simulator represents a significant advancement in orthodontic technology, improving both clinical efficiency and patient understanding.

(57) Abstract :  
ABSTRACT This invention introduces a modified torquing key integrated with a digital protractor, designed to enhance precision in wire bending and torquing during orthodontic procedures. The tool addresses the limitations of traditional torquing keys, which often rely on manual estimation, leading to inconsistencies. By incorporating a digital protractor, this device provides real-time angular measurement, reducing errors and ensuring accurate tooth movement. The lightweight, ergonomic design minimizes hand fatigue, while the use of durable, medical-grade materials ensures longevity and sterility. Its intuitive digital interface displays clear readouts, enhancing procedural confidence. This advancement represents a significant improvement in orthodontic tool design, promoting more predictable treatment outcomes for patients. Additionally, the device features two wire slots-one for .017" x .025" wires and another for .019" x .025" wires-allowing for more controlled orthodontic adjustments.

(57) Abstract :

ABSTRACT This invention introduces a wearable compliance monitoring system integrated into orthopaedic appliances such as facemask and headgear. The system consists of a Bluetooth-enabled microchip embedded within the appliance, which continuously tracks wear time and transmits data to a connected mobile application. The app provides real-time feedback, notifying patients and orthodontists if usage is insufficient. This innovation enhances patient compliance, improves treatment efficiency, and allows for remote monitoring, ensuring optimal clinical outcomes.

(57) Abstract :

**ABSTRACT:** This invention pertains to a UV-based disinfection and storage case specifically designed for removable orthodontic appliances like aligners, retainers, removable anterior planes, posterior bite planes etc to ensure effective microbial decontamination. Orthodontic appliances, being in prolonged contact with the oral environment, accumulate a significant number of bacteria, fungi, and viruses, which can lead to oral infections, bad breath, and other hygiene-related concerns. Conventional cleaning methods, such as manual brushing and chemical disinfectants, are either insufficient or inconvenient for regular use. This invention introduces an automated UV disinfection case equipped with UV -C lightemitting diodes (LEOs) strategically placed to provide uniform disinfection. The device integrates an Arduino Nano microcontroller to regulate the disinfection process, optimizing exposure time to eliminate microbial contamination while maintaining user safety. A magnetic locking mechanism ensures that the disinfection process only occurs when the case is securely closed, preventing accidental UV exposure. Additionally, a reed switch interlock system enhances safety by immediately shutting off the UV light if the lid is opened during operation. The disinfection case also features a rotary encoder for adjustable disinfection cycles, a buzzer alert system to notify users upon completion, and a compact, portable design for ease of use. The device operates on a SV switched-mode power supply (SMPS), ensuring energy efficiency and reliability. The innovative, chemical-free, and efficient design of this disinfection case significantly enhances retainer hygiene, ensuring a safe and effective disinfection process for orthodontic patients.

(57) Abstract :  
ABSTRACT: This invention presents a novel double-ended anterior and posterior composite instrument with detachable components for holding a brush on one end and a anterior Mylar strip or sectional matrix holder on the other. The core of the instrument is made of autoclavable material, ensuring sterility and durability, while the detachable parts may be autoclavable or disposable. The design enhances efficiency in composite restorations by providing a multifunctional tool that reduces the need for multiple instnnnents in case of class II, III, IV restorations, improving ease of use for dental practitioners.

(57) Abstract :  
ABSTRACT The present invention relates to a Dental Lab Bunsen Burner with an Integrated Wax Collection System and Instrument Holder. Traditional Bunsen burners used in dental laboratories often result in wax spillage, contamination, and inefficient workflow. This invention incorporates a detachable wax collector, a fixed and detachable instrument holder, a curved metal chimney, and an angulated plate for efficient wax collection. The innovation improves cleanliness, usability, and efficiency in dental labs.

(57) Abstract :  
ABSTRACT The present invention is a Teeth Selection Guide with Integrated Ruler Scale, Multiple Outline Forms, and an Interchangeable Slot Frame for completely edentulous patients. It features a flexible measuring scale, three distinct tooth outline shapes (Oval, Triangular, and Square), and a removable slot frame to compare different tooth sizes and shades. This invention improves the accuracy of artificial tooth selection, enhances efficiency in clinical settings, and provides a standardized approach for prosthetic fabrication.

(57) Abstract :  
This innovation introduces a foot perspiration monitoring system employing adapted soil moisture sensors to aid in the early detection and control of diabetes. Diabetic individuals frequently experience peripheral neuropathy and impaired sweat gland function, resulting in decreased sensitivity to sweat and Numbness compared to non-diabetic people, which may serve as an early diabetes indicator. Conventional sweat sensors are often expensive, scarcely available, and lack the necessary sensitivity and specificity for clinical effectiveness. This system addresses these issues by tracking changes in electrical resistance through soil moisture sensors, precisely calibrated to detect distinct moisture levels and classify sweat intensity as low, moderate, or high. Real-time data is displayed on a 16x2 LCD, enabling ongoing observation by patients and healthcare providers. Its compact, layered construction allows for easy integration into insoles, and vibratory alerts signal to the Numbness, encouraging prompt response. This cost-effective, modular solution is particularly suited for diabetic foot care in resource-limited environments, aiming to minimize complications and enhance foot health over the long term.

(57) Abstract :  
ABSTRACT OF THE INVENTION Oral cancer is one of the most prevalent cancers worldwide, often associated with high recurrence rates and limited success of conventional treatments due to adverse effects and systemic toxicity. The tumor microenvironment (TME), characterized by chronic inflammation, oxidative stress, and dysregulated signaling pathways, plays a pivotal role in tumor initiation and progression. Naturally derived polyphenols have shown promise as chemopreventive and therapeutic agents due to their anti-inflammatory, antioxidant, and anticancer properties. This study aims to develop a polyphenol-enriched bioactive gel for topical application in the oral cavity to target the inflammatory pathways and tumor microenvironment associated with oral cancer, thereby offering a localized and non-invasive therapeutic strategy. Polyphenol-rich extracts were obtained from selected natural sources and incorporated into a mucoadhesive gel base. The formulation was characterized for physicochemical properties including pH, viscosity, spread ability, bio-adhesion, and stability. In vitro assays were performed using oral squamous cell carcinoma (OSCC) cell lines to evaluate the anti-inflammatory, antioxidant, and cytotoxic effects of the formulation. Expression levels of key inflammatory markers (TNF- $\alpha$ , and IL-6), oxidative stress enzymes, and tumor-related signaling molecules (NF- $\kappa$ B, VEGF, and COX-2) were assessed through ELISA, qPCR, and western blotting. The polyphenol-enriched gel exhibited excellent stability, bioadhesiveness, and sustained release characteristics. In vitro studies demonstrated a significant reduction in inflammatory cytokines and downregulation of cancer-related pathways. The gel showed selective cytotoxicity towards cancer cells with minimal toxicity to normal cells. The developed topical gel represents a promising adjunct or alternative therapeutic approach for oral cancer management. By targeting the tumor microenvironment and inflammatory pathways, it offers potential benefits in both treatment and prevention, with improved patient compliance and minimal systemic toxicity.

(57) Abstract :

ABSTRACT This invention introduces a smart paediatric toothbrush integrated: with motion sensors and technology to promote proper brushing techniques and monitor .. aligner compliance. The toothbrush employs visual feedback. through colour-changing LEOs that respond to brushing angle, pressure, and duration, offering a gamified approach to oral hygiene training. Additionally, embedded sensors brushing patterns and relay this information to a companion mobile application. This function is designed to addresses paediatric dental care-effective plaque removal.

(57) Abstract :

ABSTRACT The present invention relates to an improved Petri plate, referred to as a "Metriplate", designed to ensure consistent and accurate pouring of culture media in microbiological applications. The "Metriplate" features integrated horizontal volume markings on the inner surface of its cylindrical sidewall. These calibrated markings correspond to specific media volumes, such as 10 ml, 20 ml, 30 ml, and 40 ml, and allow users to visually determine and control the volume of medium poured into the plate without the use of external measuring tools. The volume indicators are permanently incorporated using methods such as embossing, etching, or laser marking, and are resistant to sterilization procedures. The invention promotes uniformity, reduces human error, saves time, and enhances the reliability and reproducibility of laboratory procedures, particularly in research, clinical diagnostics, and teaching environments

(57) Abstract :  
ABSTRACT The present invention relates to a novel nano-formulation comprising carboxymethyl cellulose (CMC) gel doped with vitamin D, developed to enhance therapeutic efficacy on oral mucosal cells. The formulation was characterized using UV -visible spectroscopy and Fourier-transform infrared (FTIR) spectroscopy, confirming the successful incorporation of vitamin D into the CMC matrix through distinct functional group peaks. The nano-fonnulated gel demonstrated significant antioxidant and anti-inflammatory activity in comparison to standard control groups. Furthermore, cytotoxicity analysis conducted on oral cancer (KB) cell lines revealed notable anti-cancer activity, underscoring its potential in therapeutic applications targeting oral health disorders, including malignancies. This innovative formulation presents a promising approach for the treatment and management of oral mucosal conditions.

(57) Abstract :  
ABSTRACT The present invention discloses the green synthesis of calcium oxide nanoparticles (CaONPs) using Basella alba leaf extract as a bioreducing and stabilizing agent. The synthesized nanoparticles demonstrate significant antimicrobial activity against various oral pathogens including Streptococcus mutans, Staphylococcus aureus, Lactobacillus spp., Enterococcus faecalis, and Candida albicans. The process involves the preparation of an aqueous extract from dried Basella alba leaves, followed by the reaction with a calcium hydroxide solution under controlled conditions, resulting in the formation of CaONPs. These nanoparticles are characterized by high biocompatibility and efficacy in inhibiting microbial growth, indicating their potential for use in oral healthcare formulations such as mouth rinses, toothpastes, and wound healing gels. The invention provides an environmentally friendly and scalable solution to combat oral infections while avoiding the side effects of conventional antibiotics.

(57) Abstract :  
ABSTRACT The invention introduces a compact, ergonomic adhesive dispenser designed to be worn on the index finger during orthodontic bonding procedures. Featuring a single-use, snap-in composite cartridge, the device delivers an optimized quantity of bonding material for one full-mouth bonding session (20--28 brackets). Its vertically mounted cartridge mimics the form of a miniature ink bottle and enables direct dabbing via a non-stick tip surface. The opaque, light-blocking body prevents premature curing, and its minimalistic footprint supports enhanced workflow, aseptic handling, and composite conservation in busy or space restricted clinical environments

(57) Abstract :

Enhancing animal well-being through serveprani - an integrated platform for comprehensive animal care is the proposed invention. The issues rising from the keeping of pets in rapidly urbanizing areas, especially access to reliable pet care services. With lifestyle change due to urbanization, pet-keeping creates grave problems for owners in obtaining credible veterinary care, grooming services, and arrangements for pet-sitting due to pressures exerted by modern urban life. It attempts to address the crucial issue of lost pets and the logistics associated with reporting and finding them in crowded cities. Pet adoption of homeless pets is difficult, due to finding of new pet adopters. Along with this, it also presents ways and means that are available to divert food waste from restaurants and supermarkets to nourish animals. This leads it to link urban pet care challenges with resource management and sustainability. Identifying potential solutions capable of improving quality and efficiency of pet care services simultaneously with addressing the issues associated with food waste, the ServePrani finds solution for the challenges.

(57) Abstract :

This project presents a hand-tracking servo control system that integrates computer vision and embedded systems to enable gesture-based control of five servo motors. Utilizing a webcam, Python with OpenCV and MediaPipe, and an Arduino microcontroller, the system detects hand landmarks in real-time and maps finger-to-wrist distances to servo angles (0-180 degrees). These angles are transmitted via serial communication to an Arduino, which actuates the servos to mimic hand movements, suitable for applications like robotic hands or human-machine interfaces. The implementation addresses challenges such as serial port access errors, hand-tracking jitter, and servo power requirements through robust error handling, distance calibration, and external power supplies. Testing demonstrates accurate and responsive control, with potential improvements in gesture mapping and smoothing for enhanced precision. This system serves as an educational tool and a foundation for advanced gesture-controlled robotics.

(57) Abstract :  
A multimodal sentiment and emotion analysis system is deployed by integrating NLP, deep learning, and machine learning across text, image, audio, and video data sources. Text sentiment analysis employs RoBERTa, XLM-T, XLM-R, and OpenAI’s text-davinci-003, with text-davinci-003 yielding the highest accuracy of 94.1%. Image emotion analysis utilizes VGG16 CNN, reaching 87.5% accuracy on the FER2013 dataset. Audio sentiment analysis applies LSTM-based deep learning models, attaining 83.9% accuracy. Video sentiment analysis combines MoviePy, Speech-to-Text APIs, and NLP-based sentiment extraction, achieving 85.2% accuracy. YouTube sentiment analysis leverages the YouTube Data v3 API with NLP techniques, producing 88.4% accuracy, while Twitter sentiment analysis integrates the Apify API with RoBERTa, resulting in 90.7% accuracy. Threat detection is performed using logistic regression (86.3%) and LSTM-based deep learning models (91.2%). Social media monitoring employs BERT, reaching 93.0% accuracy. Chat data sentiment analysis utilizes Naïve Bayes (84.5%), and general NLP-based sentiment classification applies SVM (88.9%).

(57) Abstract :

The present invention provides a special nourishment feed for promoting wound repair in zebrafish (Danio rerio). The nourishment for promoting wound repair is prepared from the medicinal extract, comprising: a combination of Lawsonia inermis and Acalypha indica in a synergistically effective amount together. The wound healing activity of medicinal extract combination of Lawsonia inermis and Acalypha indica suggest that could potentially serve as a valuable candidate for promoting wound healing when used as combination drug. The wound healing medicinal extract as a fish feed is prepared by mixing 100 µL of Acalypha indica extract, 100 µL of Lawsonia inermis extract, and 800 µL of distilled water with 1 gram of standard fish feed, blending the mixture thoroughly to ensure uniform distribution of the extracts, molding into small pellets suitable for zebrafish consumption and air-drying and storing the pellets in a sterile container until use. In addition, the invention also provides a process for the preparation of Lawsonia inermis and Acalypha indica extracts. The wound healing assessments showed accelerated tissue regeneration and epithelialization highlighting its therapeutic efficacy and the synergistic use of Lawsonia inermis and Acalypha indica offers a promising natural alternative for managing inflammation, oxidative stress, and wound healing.

(57) Abstract :

The present invention discloses a next-generation Light Fidelity (Li-Fi) communication system integrated with artificial intelligence (AI) for real-time data encryption and adaptive transmission control. The system comprises an LED-based transmitter, a photodiode receiver, and an AI-powered encryption engine that dynamically selects encryption algorithms and adjusts security parameters based on data classification, environmental inputs, and threat detection. It features intelligent beamforming, anomaly detection, and secure authentication to provide a highly secure, energy-efficient, and context-aware optical wireless communication solution suitable for critical applications in healthcare, autonomous systems, military operations, and smart infrastructure.

(57) Abstract :

The present invention discloses a digital examination system that ensures secure, authenticated, and proctored online assessments through the integration of biometric authentication and AI-based automated monitoring. The system authenticates candidates using facial recognition or fingerprint scanning both at login and intermittently during the examination. An intelligent proctoring engine continuously analyzes video, audio, and screen activity to detect suspicious behavior such as candidate absence, multiple faces, or unauthorized background noise. A secure examination browser further prevents screen switching and external access. All activities are logged and processed to generate detailed audit reports, thereby ensuring examination integrity, identity verification, and scalable administration of remote or in-person digital assessments.

(57) Abstract :

[029] The present invention relates to a system and method for implementing a self-evolving machine learning algorithm designed to autonomously enhance predictive analytics in dynamic data environments. The disclosed system comprises integrated modules including real-time data ingestion, automated preprocessing, a feature evolution engine, adaptive model reconfiguration, autonomous hyperparameter tuning, and a continuous feedback loop. These components collectively enable the system to modify its internal structure, features, and parameters in response to shifts in data patterns without human intervention. The invention supports real-time learning and decision-making across various application domains such as finance, healthcare, industrial automation, and cybersecurity. By facilitating continuous model evolution, contextual adaptation, and performance optimization, the invention significantly improves prediction accuracy, robustness, and system autonomy in non-stationary, high-velocity environments. Accompanied Drawing [FIGS. 1-2]

(57) Abstract :  
The invention titled "A Systematic Method for Brain Abnormality Detection and Classification Using Emerging Technologies" presents an intelligent framework for accurate and efficient diagnosis of brain disorders. Traditional diagnostic methods often rely on manual interpretation of neuroimaging data, which can be time-consuming, prone to error, and less effective in early-stage detection. This invention overcomes these limitations by integrating advanced technologies such as artificial intelligence, deep learning, and high-resolution imaging modalities like MRI and CT. The method involves preprocessing of brain images, automated feature extraction using deep neural networks, and classification of abnormalities such as tumors, hemorrhages, or degenerative conditions. An attention mechanism further enhances the system's ability to focus on critical brain regions, improving diagnostic precision. By automating the detection process, this invention reduces diagnostic delays, minimizes human error, and assists clinicians in making data-driven, accurate treatment decisions.

## (57) Abstract :

Augmented Reality (AR) technology is transforming rehabilitation medicine by solving the main problems of conventional therapy. Conventional rehabilitation has problems with patient compliance, motivation and accessibility, especially in rural or underserved communities. AR technology provides new solutions, particularly in shoulder rehabilitation, where accurate movement and form are essential. AR systems produce interactive, immersive environments that revolutionize the rehabilitation experience. For shoulder recovery, the systems offer real-time feedback on exercise performance, movement patterns, and joint angles, avoiding compensatory movements that may impede recovery [1]. Patients can monitor progress, compete against previous performance, and join multiplayer sessions with other patients to build social interaction during the healing process. Home therapy sessions are made possible through the technology, enhancing accessibility while ensuring the quality of care [4]. Real-time feedback is a key innovation, instantly notifying patients of improper movements and offering corrective guidance [5]. The feedback cycle is important in the formation of correct movement patterns and muscle memory, especially in shoulder rehabilitation. The system has adaptive ability to accommodate individual progress, automatically modifying exercise difficulty to ensure optimal challenge. The capability of the technology lies not just in improving current therapy. Machine learning programs that are incorporated within AR systems compare trends in patient performance and create tailored treatment protocols that can respond in real-time [6]. Movement data collected from large numbers of patients might accelerate insights into rehabilitation results and refine treatment practices [7]. Yet, AR rehabilitation is not without challenges, such as initial equipment expense, technical expertise demands, and maintenance requirements. Further research is needed to confirm its long-term efficacy against conventional rehabilitation. Privacy and data protection issues must also be addressed since these systems deal with sensitive patient data. The system involves Unity AR Core for rehabilitation use, Mixamo AR models for movement simulation, Media Pipe for real-time pose estimation, and Google Maps API integration for finding physiotherapists. The integrated system seeks to improve rehabilitation through real-time tracking and interactive exercises, thereby improving patient compliance and treatment outcomes, compliance and treatment outcomes.

(57) Abstract :

The present invention relates to a method and system for dynamic identity management across multiple digital platforms, wherein a secure identity relay device (SIRD) generates a contextually adaptive, cryptographically secured dynamic identity token (DIT) based on real-time biometric input, behavioral telemetry, device attestation, and environmental context. The invention employs a decentralized identity orchestration engine (DIOE) operating over a distributed ledger to verify, synchronize, and manage identity tokens, while a context-aware trust resolution module (CTRM) dynamically evaluates trust scores for each session. An adaptive policy negotiation subsystem (APNS) facilitates real-time alignment between platform-specific access control policies and user-defined privacy preferences. The identity tokens are structured for selective disclosure using attribute-based encryption and are cryptographically anchored to a core identity kernel (CIK) stored securely within the SIRD.

(57) Abstract :  
MACHINE LEARNING & IOT BASED DYNAMIC BANDWIDTH ALLOCATION SYSTEM FOR 6G WIRELESS NETWORKS ABSTRACT This invention presents a Machine Learning & IoT-Based Dynamic Bandwidth Allocation System for 6G wireless networks, utilizing Reinforcement Learning (RL) algorithms to optimize bandwidth allocation. The system integrates real-time data from IoT devices to predict network traffic patterns and dynamically adjust bandwidth resources. By employing the Real-Time Traffic Prediction and Dynamic Allocation method, the system monitors and analyzes traffic data to forecast future demand, enabling proactive adjustments in bandwidth distribution. The RL algorithm plays a key role in learning optimal allocation strategies through continuous feedback from the network environment. As traffic conditions change, the RL model adapts its decisions, ensuring efficient bandwidth utilization, reduced latency, and minimized congestion. This approach is designed to enhance the performance and reliability of 6G networks, supporting mission-critical applications like autonomous vehicles, smart cities, and industrial IoT while maintaining seamless connectivity in diverse and demanding environments.

(57) Abstract :

ABSTRACT The present invention relates to an AI (Cardiopulmonary Resuscitation) device that integrates real-time non invasive pulse sensing and intelligent compression control to optimize the effectiveness of CPR. Utilizing advanced photoplethysmography (PPG) sensors placed on the carotid artery, the device continuously monitors the patient's heart pulse during CPR. The collected pulse data is analyzed by an intelligent unit to assess the patient's condition and adapt chest compressions in real-time. The device features customizable settings for various patient profiles, including age, size, and medical history. It also includes safety features such as a pulse signal that indicates whether CPR should continue, AI-controlled piston movement, and an emergency cut-off mechanism. Additionally, the device is equipped with rechargeable batteries and cloud-based data storage for real-time monitoring and post-CPR analysis.

(57) Abstract :  
DEVELOPING SPEAKING SKILLS OF TRIBAL SECONDARY SCHOOL LEARNERS OF RAMPACHODAVARAM DIVISION: AN EXPERIMENTAL STUDY  
This study presents a method for detecting fluency improvement using pre- and post-intervention scores in pronunciation, accuracy, vocabulary, and interaction. Conducted with tribal secondary school students at the Government Tribal Welfare Ashram High School in Rampachodavaram Division, the research aims to enhance their English-speaking skills. The intervention's impact was assessed through a comprehensive analysis of pre-test and post-test assessments, student interviews, and classroom observations. The study explored challenges faced by tribal learners, effective engagement strategies, and linguistic implications of language acquisition. It highlights how student-focused training and adequate resources can significantly boost student engagement. Empirical findings are categorized into five themes: barriers to learning English speaking skills, engagement methods, characteristics of effective learning materials, linguistic implications, and student support. Quantitative analysis, utilizing frequency distribution, mean, and standard deviation for the five speaking skills, provides robust statistical evidence. The results demonstrate enhanced speaking skills among tribal learners' post-intervention, validating observed trends. FIG.1

(57) Abstract :

The invention provides an AI-based patient monitoring device capable of real-time acquisition, analysis, and prediction of vital physiological parameters using a sensor array and machine learning algorithms. The system includes a touchscreen display for real-time vitals and alerts, and supports patient-specific modeling for intelligent decision-making. An edge AI engine enables local data processing for immediate alerts and predictive diagnostics, even without internet connectivity. The device integrates with EHR systems and telemedicine platforms via secure, encrypted cloud services. Optional features include voice-based interaction, motion detection, and glucose monitoring. Its portable, battery-operated design allows deployment in hospitals, ambulances, and home care. The invention aims to provide early warnings, enhance clinical accuracy, and support caregivers in real-time healthcare delivery through intelligent automation and personalized monitoring.

(57) Abstract :

This article exhibits a Kretschmann configuration-based plasmonic optical biosensor, which has the access of label-free detection and real-time. To analyze the sensor's performance for the detection of methane gas at a wavelength of 633 nm, the transfer matrix technique is exploited with the help of the angular interrogation procedure. This proposed sensor owns an advantage in form of surface plasmons excitation through the silver. Additionally, a novel dielectric material, arsenic trisulfide, is introduced for the first time in the sensor to enhance sensor's performance as well as to acts protection for the Ag's oxidization. Initially, the thickness optimization for the considered layers is shown by analyzing the better minimum reflectance and sensitivity. Subsequently, the impact of the proposed sensor by comparing its performance with other structures, which are designed with the considered layers. With optimal structure, the sensor's performances are analyzed for the detection methane gas for different TDMC heterostructures and found that the maximum attained parameters are a sensitivity of 259.69 deg/RIU, a QF of 78.67 RIU<sup>-1</sup>, and a DA of 4.56. These results show a significant improvement with the existing work for the detection of methane gas. Finally, the electric field intensity for the sensor is shown, following by the standard fabrication steps at the end.

(57) Abstract :

The present invention relates to a photocatalytic ternary nanocomposite and a method for its synthesis. A photocatalytic ternary nanocomposite and a method for its synthesis are disclosed. The nanocomposite comprises rod-like zinc oxide (ZnO) nanoparticles and spherical silver (Ag) nanoparticles co-anchored on reduced graphene oxide (rGO) sheets. An optimized composition comprises approximately 54 wt% ZnO, 36 wt% rGO, and 9 wt% Ag, exhibiting efficient dye degradation under visible light. The material is characterized by a Z-average particle size of 15-20 nm and a BET surface area of 20-30 m<sup>2</sup>/g with a Type IV isotherm. The synthesis method is a novel, energy-efficient process comprising a one-pot solvothermal reaction at 140-160°C. A key feature is the use of a green deep eutectic solvent (DES) of choline chloride and glycerol. The final nanocomposite is recovered without a subsequent calcination step, providing a sustainable and effective catalyst for the environmental remediation of industrial wastewater.

(57) Abstract :

Disclosed is a blockchain anti mobile theft system (100) comprising a second user device (104) adapted to remotely delete photos, videos, files, data, and access control associated with a first user device (102), comprising an input unit (109) that receives one or more instructions from said user, an output unit (115) that sends confirmation and alert message and a processing circuitry (112) communicatively coupled with said input unit (109) and output unit (115), and said processing circuitry (112) configured to receive (116) a user's complaint, block (118) said first user device (102) through an unique identification number, send (120) block confirmation messages to SIMa and local police station, store (122) blacklisted unique identification numbers of stolen mobiles, replicate (124) information on said user device (102) amongst said one or more servers (106), group (126) valid transactions to create valid blocks, deny (128) access to unauthorised user through any SIM. Figure 1 will be the reference.

(57) Abstract :  
METHOD AND SYSTEM FOR OUTSOURSING DECISION-TREE INFERENCE AND OBFUSCATING DECISION-TREE ATTRIBUTES ABSTRACT A method and a system for outsourcing decision tree inference involving decision tree attribute obfuscation. Embodiments provide a privacy-preserving outsourced decision tree classification framework that incorporates an attribute-hiding mechanism to obfuscate attributes of nodes of a decision tree model, which is to be inferred for classification task based on a query data. Embodiments provide the framework that ensures robust protection of the attributes of the decision tree model, addresses transmission overhead issues associated with transmission of a share of the query data from the first device to the second device (by employing a seed-based pseudorandom generator for compressing the share of the query data), ensures enhanced privacy for users, and improves scalability for practical deployment in resource-constrained environments. (57) Abstract :  
Autonomous AI-Powered R&D Pods for Real-Time Crop Monitoring and Precision Agriculture Abstract: The advent of Autonomous AI-powered R&D Pods marks a transformative step in precision agriculture, offering innovative solutions for real-time crop monitoring and optimized farm management. These self-sustaining pods are equipped with state-of the-art artificial intelligence and machine learning capabilities, enabling them to autonomously navigate agricultural fields and collect valuable data on key parameters such as soil composition, moisture content, pest activity, plant health, and environmental conditions. By utilizing a combination of sensors, drones, and satellite imaging, these pods continuously monitor crops, delivering highly granular insights that empower farmers with data-driven decision-making tools. The AI algorithms process vast amounts of data to generate actionable insights, offering precise recommendations for irrigation, fertilization, pest control, and crop rotation strategies. This enables farmers to optimize resource use, reduce waste, and enhance crop productivity while minimizing environmental impact. Through continuous real-time monitoring, the pods are capable of identifying early signs of disease, nutrient deficiencies, or pest infestations, allowing for proactive intervention. Moreover, the autonomous nature of these pods reduces the need for manual labor and allows for 24/7 operation, maximizing efficiency and scalability in agricultural practices. By seamlessly integrating smart agriculture techniques with traditional farming, these R&D pods pave the way for more sustainable, cost-effective, and resilient farming practices. Ultimately, this innovation holds the potential to significantly increase food security, reduce environmental footprints, and foster a more resilient agricultural ecosystem.

(57) Abstract :  
METHODS AND SYSTEMS FOR OUTSOURSING DECISION-TREE INFERENCE WHILE OBFUSCATING DECISION-TREE ATTRIBUTES ABSTRACT  
Methods and systems for outsourcing decision tree inference while obfuscating decision tree attributes is provided. Embodiments provide privacy-preserving outsourced decision tree classification frameworks that incorporate an attribute-hiding mechanism to obfuscate attributes of nodes of a decision tree model, which is to be inferred for classification task based on a query data. Embodiments provide the frameworks that ensures robust protection of the attributes of the decision tree model, address transmission overhead issues associated with transmission of a share of the query data from a first device to a second device (by employing a seed-based pseudorandom generator for compressing the share of the query data), ensure enhanced privacy for users, and improve scalability for practical deployment of the frameworks in resource-constrained environments. (57) Abstract :  
METHODS AND SYSTEMS FOR MUTUAL TRUST MULTI-FACTOR AUTHENTICATION ABSTRACT Device-specific parameters are sent to a device (204) for performing a registration of the device with a server (202) being executing within a confidential computing environment (206). A digital certificate for the device is generated. A signed digital certificate for the device is generated. The signed digital certificate is sent to the device. A mutual authentication request is received from the server. A digital certificate of the server and secure runtime attestation for the server are obtained. An initial handshake of the device with the server is established. A location-aware one-time password (OTP) is generated. The location-aware OTP and the signed digital certificate are sent by the device, to the server. The location-aware OTP and the signed digital certificate of the device are validated at the server, to confirm an authenticity of the device. Access to the device is granted for securely performing operation(s). FIG. 2

(57) Abstract :

ABSTRACT METHOD AND SYSTEM FOR TRACKING GAZE OF USERS ON A DISPLAY Method (500) and system (400) of the present disclosure relate to tracking gaze of one or more users (101) on a display (103). The method (500) comprises capturing (502) a plurality of two-dimensional (2D) images of an environment and generating (504) a three-dimensional (3D) model of the environment based on the plurality of 2D images. The method (500) also comprises receiving (506) gaze data from a remote eye-tracking system and projecting (508) the gaze vector from the gaze origin into the 3D model. Moreover, the method (500) comprises determining (510) an intersection point between the projected gaze vector and a surface of the 3D model and obtaining a 3D gaze point based on the determination. Lastly, the method (500) comprises tracking (512) a gaze location of the one or more users based on the 3D gaze point. Figure 1

(57) Abstract :

A method (900) and a blockchain system (200) for managing communication between one or more IoT devices registered with a decentralized blockchain network is disclosed. The method (900) includes authenticating an IoT device from among the registered IoT devices based on an encrypted identifier and information associated with IoT device. The information is associated with IoT device includes unique identifier associated with IoT device. In response to successful authentication of IoT device, the method (900) includes sending, to a Message Queuing Telemetry Transport (MQTT) manager, a request for generating a certificate required to enable authenticated IoT device to communicate with other IoT devices from among the registered IoT devices. The method (900) includes receiving generated certificate from MQTT manager. The generated certificate comprises credentials for IoT device. The method (900) includes sending, to the authenticated IoT device, received certificate enabling IoT device to communicate with the other IoT devices. <>

(57) Abstract :

The present disclosure relates to an electrochemical biosensor and method for detecting and quantifying creatinine in a biological sample. The biosensor can include a working electrode (102-1) consisting of a copper (Cu) wire coated (103-1) with molybdenum disulfide nanosheets (MSNS) (103-2), wherein the MSNS are configured to provide active-edge sites that enhance electrocatalytic activity. The biosensor further includes a reference electrode (102-2) comprising silver/silver chloride (Ag/AgCl), a counter electrode (102-3) comprising a spiral platinum wire, and an electrolyte solution (104) comprising a phosphate buffer solution (PBS) with a pH of approximately 7.0. The biosensor is configured to perform electrocatalytic oxidation of creatinine at the working electrode surface when operatively connected to an external potentiostat (106) for electrochemical measurements.

(57) Abstract :

A streetlight (100) for public safety, traffic management, and adaptive lighting customized for cultural events includes a camera (102) assembled on an adjustable pole (202) having a light (204) to capture visuals of the ambient surroundings; a sensor (104) configured on the adjustable pole (202) to sense speed of vehicles; a microcontroller (106) comprising one or more learning modules (106A) and a memory (106B) with a pre-fed calendar data, the microcontroller (106) in communication with the camera (102) and the sensor (104) analyses the visual data and the sensed data, adjust height of the adjustable pole (202), customizes illumination of the streetlight (100) based on the pre-fed calendar, and detect abnormal activities in the ambient surroundings, the speed of the vehicles crossing the streetlight (100).

(57) Abstract :  
The invention offers multiple significant advantages over prior art. By using potassium instead of sodium, the formulation eliminates soil salinization risks and ensures long-term soil health. The synergy of boron and potassium enhances nutrient uptake, photosynthesis, and reproductive development in crops. The invention's foliar application route allows faster absorption and bypasses soil-related uptake issues, making it ideal for rain-fed or marginal lands. Unlike conventional drying methods that require high energy inputs, the invention utilizes solid wet-feed drying, drastically lowering energy consumption and production cost. Furthermore, the process recycles mother liquor and minimizes waste discharge, contributing to an environmentally sustainable and zero-liquid-discharge process. The resultant DPOBT composition exhibits field-validated improvements in crop height, biomass, yield, and fruit quality across diverse crop types. Its versatility and ease of formulation offer significant value to both smallholder farmers and large-scale agricultural operations.

(57) Abstract :  
Embodiments of the present disclosure relate to an apparatus for air quality management (100) for air quality management and localized cooling by simultaneous extraction of hot air and cooling of ambient environment. The apparatus (100) includes a chimney (102) for ventilation and cooling. An exhaust section (112) removes hot air through an exhaust vent pipe (106) connected to an exhaust vent setup (104), aided by an exhaust fan (124). Above, an air conditioning section (114) uses a partition layer (116) to separate airflow. Liquid nitrogen enters via an expansion valve (118), cools through a first heat exchanger (130), and flows in a plurality of liquid nitrogen pipes (122). A condenser (120) and a second heat exchanger (132) expel heat. Cooled air is released through a vent (108), controlled by a vent flap control (110). An air conditioning fan (126) circulates the cooled air forming the efficient and compact cooling-ventilation apparatus (100).

(57) Abstract :  
ABSTRACT High-k Dielectric Engineered InSe-Based Field-Effect Transistor for Enhanced Analog and RF Performance A dielectric-engineered transistor structure is disclosed, comprising a layered semiconducting channel symmetrically enclosed between high-permittivity dielectric layers and modulated through a dual-gate configuration. The source and drain regions are doped, and the central channel remains intrinsic. The dielectric layers have distinct permittivity values to optimize electrostatic coupling. Control electrodes positioned on both sides of the channel enable effective modulation of carrier transport. This structure enhances transconductance, intrinsic gain, and high-frequency performance parameters such as cut-off frequency and gain-frequency product. The overall configuration is compatible with ultra-scaled fabrication processes and demonstrates improved signal handling, reduced leakage, and efficient field modulation under nanoscale operation. Performance is evaluated using self-consistent quantum transport models. Figure 1

(57) Abstract :

ABSTRACT System and Method for Airborne Environmental Monitoring Using Spectral Imaging The invention discloses a system and method for airborne environmental monitoring using a mobile aerial platform equipped with a spectral imaging sensor. The platform is configured to follow predefined flight paths using geolocation and orientation modules. A sensor captures electromagnetic data across a continuous spectral range, and this data is processed using correction techniques to normalize reflectance values. The processed data is then analyzed by comparing spectral profiles to known references to identify the presence of airborne constituents. The system includes onboard and offboard units for data acquisition, correction, and mapping, with visual outputs rendered as geo-referenced distribution maps. The integration of sensing, positioning, and data interpretation modules enables dynamic and high-resolution spatial monitoring of atmospheric conditions. Figure 1

(57) Abstract :

Disclosed is a system (200) to perform an intensity-based optical interrogation. In the system (200), a transmitting module (202) generates one or more pulsed signals. A Fiber Bragg Grating (FBG) module (211) receives the one or more pulsed signals and includes a sensing FBG (212) and a reference FBG (214) to reflect a sensing signal pulse at a sensing Bragg wavelength ( $\lambda_S$ ) and a reference signal pulse at a reference Bragg wavelength ( $\lambda_R$ ) respectively. An edge filter (218) converts a shift in the  $\lambda_S$  into an intensity variation based on a characteristics curve (300) for optical interrogation. The  $\lambda_S$  and  $\lambda_R$  are positioned on a slope region and on a flat region (306) of the characteristics curve (300), respectively. The shift in the  $\lambda_S$  and the corresponding intensity variation after passing through the edge filter (218) are induced by one or more physical parameters acting on the sensing FBG (212).

(57) Abstract :

AI Integrated Smart Edge Systems for Realtime Decision Making in Decentralized Environments Abstract In the era of pervasive computing and decentralized architectures, the demand for intelligent, autonomous systems at the edge has grown exponentially. This paper proposes a novel framework titled AI Integrated Smart Edge Systems (AISES) for real-time decision making in decentralized environments. Unlike traditional centralized models that rely heavily on cloud infrastructures, AISES leverages federated deep reinforcement learning and neural symbolic processing directly at the edge nodes, enabling rapid, context-aware decisions with minimal latency. The proposed system employs multi layered edge AI cores, integrating quantized convolutional neural networks (Q-CNNs) with adaptive attention transformers to optimize inference across constrained devices. A self-correcting feedback loop, governed by a decentralized consensus algorithm (enhanced Raft protocol), improves decision reliability and energy efficiency. In comparative tests across smart agriculture, traffic control, and industrial IoT use cases, AISES demonstrated 92.8% accuracy, 23% reduction in latency, and 31% improvement in decision throughput compared to conventional edge-cloud hybrid models. Key innovations include edge-optimized semantic compression for faster data transmission, privacy-preserving federated updates for model retraining without raw data exposure, and event-driven prioritization mechanisms that enhance system responsiveness by up to 40% under high-load conditions. The architectural scalability supports over 1,000 concurrent edge agents, maintaining system efficiency above 88%, even in dynamically changing network topologies. This research sets a new benchmark in edge intelligence, pushing the boundaries of autonomous, real-time, and distributed AI systems for next-generation decentralized applications in smart cities, autonomous vehicles, and disaster response systems. Future work explores self-organizing swarm architectures and integration with neuromorphic edge hardware. Keywords—Edge AI, Federated Learning, Real-Time Decision Making, Decentralized Systems, Neural Symbolic Processing, Adaptive Transformers, Latency Reduction, Semantic Compression, Privacy-Preserving AI, Autonomous Systems, Smart Edge Devices, Performance Optimization.

(57) Abstract :

Abstract The invention relates to an AI-driven decision support system designed to enhance strategic business management and operational efficiency. The system integrates data from diverse sources—including enterprise platforms and external feeds—into a unified analytical environment powered by machine learning, reinforcement learning, and prescriptive analytics. A natural language interface allows users to pose business queries in conversational language and receive actionable insights, while a scenario simulation module enables modeling of hypothetical business conditions and forecasting of associated outcomes. An explainable AI module provides transparent justifications for recommendations, fostering user trust and regulatory compliance. Through real-time data analysis, intelligent forecasting, and adaptive learning, the system offers a comprehensive and scalable solution for executive decision-making, cross-departmental planning, and performance optimization. The invention supports modular deployment, secure data access, and integration with third-party systems, offering enterprises a transformative tool to align strategic vision with operational execution in a dynamic business environment.

(57) Abstract :  
Abstract The invention provides a smart, AI-driven framework for resource allocation in real-time project management, leveraging predictive analytics to optimize personnel, budget, and asset distribution across dynamic tasks. The system includes a real-time data acquisition unit, a machine learning-based predictive analytics engine, a resource optimization module, a conflict detection and resolution engine, and an intuitive user dashboard. It forecasts workload trends, identifies potential bottlenecks, simulates optimal allocation scenarios, and provides actionable recommendations. Integrated feedback mechanisms continuously refine prediction accuracy. The system interfaces with project and ERP tools and enables proactive decision-making to minimize delays, maximize resource efficiency, and adapt to real-world project changes. Designed for enterprise scalability and cross-platform deployment, it serves as a next-generation tool for intelligent project resource management.

(57) Abstract :  
Abstract The invention provides a blockchain-based transparent workflow management system tailored for enterprise-level operations involving multiple stakeholders and complex business processes. It integrates a permissioned blockchain ledger to immutably record workflow events, enabling verifiable transparency and auditability across organizational boundaries. Smart contracts automate rule enforcement, ensuring that workflows progress according to predefined logic without manual intervention. A modular workflow engine allows the graphical configuration of processes, while a middleware layer facilitates integration with existing ERP, CRM, and legacy systems. Role-based and attribute-based encryption ensures fine-grained access control to sensitive data. A real-time dashboard offers process analytics and alerts, improving operational efficiency and compliance. The system supports multi-tenancy, consortium governance, and AI-powered workflow optimization. By combining decentralization, cryptographic security, and enterprise-grade interoperability, the invention enhances trust, accountability, and scalability in managing enterprise workflows across distributed environments.

(57) Abstract :  
Abstract The present invention discloses an Adaptive Risk Assessment and Mitigation System designed to operate effectively within dynamic and rapidly evolving business environments. The system integrates artificial intelligence, machine learning, and real-time data analytics to continuously evaluate, prioritize, and respond to multifaceted operational, financial, regulatory, and strategic risks. Unlike traditional static risk models, this invention utilizes feedback loops, contextual decision matrices, and adaptive modeling to detect emerging threats and opportunities in real time. By integrating internal organizational data with external variables such as market trends, economic indicators, and geopolitical developments, the system dynamically adjusts risk scores and recommends mitigation strategies tailored to specific business functions. Furthermore, it facilitates scenario simulations, impact forecasting, and automated policy generation, ensuring organizational resilience and agility. The invention enables decision-makers to proactively respond to risks rather than react to consequences, thereby fostering sustainable growth and operational continuity across diverse business sectors.

(57) Abstract :

Abstract: The present invention discloses an Integrated Performance Monitoring and Feedback Optimization System for Human Resource Management that combines real-time analytics, AI-driven behavior tracking, sentiment analysis, and adaptive feedback loops to enhance employee performance, engagement, and organizational efficiency. The system employs a multi-layered data architecture capturing structured and unstructured data from communication tools, project management platforms, biometric inputs, and performance reviews to generate dynamic employee profiles. An intelligent recommendation engine identifies areas of improvement and suggests timely, personalized interventions including feedback strategies, upskilling modules, or mental wellness resources. Managers receive actionable insights via an interactive dashboard, while employees are provided with constructive, privacy-respecting feedback in real-time. The system emphasizes ethical data collection, compliance with labor standards, and customizable parameters to fit various industries. This invention transforms traditional HR practices by offering a scalable, automated, and intelligent system that not only tracks performance but also drives behavioral change and continuous improvement across the workforce.

(57) Abstract :

Intelligent Assistive System for Early Detection and Personalized Intervention of Learning Disabilities Using Multimodal AI Technologies"

ABSTRACT: Learning disabilities such as dyslexia, dysgraphia, and dyscalculia affect a substantial portion of children globally. These conditions often remain undiagnosed during early stages, leading to diminished academic performance, lowered self-esteem, and social challenges. Early identification combined with tailored interventions significantly improves learning outcomes and confidence. This invention introduces an integrated AI-based assistive system designed to detect and support children with dyslexia, dysgraphia, and dyscalculia. It leverages advanced machine learning, natural language processing, optical character recognition (OCR), and speech processing to analyze, diagnose, and provide corrective feedback for reading, writing, and math challenges. Its scalable architecture ensures broad applicability in educational and clinical settings.

(57) Abstract :

AI-Driven Personalized Learning System for Real-Time Student Performance Analysis Using Machine Learning Algorithms ABSTRACT: This research examines the impact of AI-based personalised learning systems on students' engagement, performance, and participation, as well as the ethical and practical challenges associated with AI implementation in education. Artificial Intelligence (AI) is revolutionising the educational experience to enhance personalisation. It is an adaptive AI system designed to customise the educational experience based on each student's abilities, interests, and performance. The platform employs machine learning, sophisticated algorithms, and real-time data to continuously assess students' performance and modify the complexity of content according to their grade level, facilitating accelerated learning and sustained motivation. This technique is highly inclusive. It enables students to engage in autonomous learning, promotes interaction, and addresses the deficiencies of conventional education by accommodating many learning styles. By making education accessible to all, it ensures equitable possibilities for every student, regardless of their background. This AI model provides pupils with future-oriented skills and fosters autonomous thinking and problem-solving abilities. As education expands, this innovative platform fosters a more supportive learning environment centred on students, ultimately improving educational outcomes and promoting lifelong learning.

(57) Abstract :

ABSTRACT: Title: An Artificial Intelligence (AI)-based System for Biomarker Detection and Method of Operation The present disclosure proposes an artificial intelligence (AI)-based system (100) that analyzes genomic and proteomic sequences for identifying statistically significant biomarkers correlated with biological signals observed in metabolic conditions such as type 2 diabetes mellitus (T2DM). The AI-based system (100) comprises a computing device (102) having a processor (104) and memory (106) for storing one or more instructions executable by the processor (104). The processor (104) is configured to execute a plurality of modules (108) for analyzing biological sequence data and identifying statistically significant features associated with genomic and proteomic sequences. The plurality of modules (108) comprises a data acquisition module (110), an encoding module (112), a processing module (114), an evaluation module (116), an updating module (118), and an output module (120). The proposed AI-based system (100) significantly reduces biological data analysis time from hours to minutes, thereby enabling rapid processing of biological sequence data in research and computational pipelines

(57) Abstract :

ABSTRACT: Title: Artificial Intelligence (AI)-Powered Refuelling Assistant System for Fuel Stations and Method of Operation The invention relates to an artificial intelligence (AI)-powered refuelling assistant system (100) that enables real-time monitoring, automated fuel type verification, error-preventive dispensing, and electromagnet-controlled nozzle locking. The AI-powered refuelling assistant system (100) comprises AI-powered cameras (102), fuel dispensers (104), a control management unit (110), a vehicle-integrated subsystem (114), and a mobile application (120). The AI-powered refuelling assistant system (100) integrates vehicle-specific data obtained via OBD-II or license plate recognition to automatically authenticate the correct fuel type and physically restrict access to incompatible fuel nozzles 106A or 106B using electromagnetic actuation mechanisms. The AI-powered refuelling assistant system (100) monitors fuel dispenser activity, fuel station staff availability, and real-time congestion at multiple stations, and utilizes predictive models to guide users to the optimal station based on waiting time, fuel quality, user preferences, and emergency fuel requirements.

(57) Abstract :

A plant extract-based seed treatment formulation, comprises of: Pongamia leaf extract in a range of 30-40% by weight, Neem leaf extract in a range of 10-20% by weight, Clove extract in a range of 10-20% by weight, Cinnamon bark extract in a range of 10-20% by weight, and Lemongrass extract in a range of 10-20% by weight. A method for preparation of plant extract-based seed treatment formulation, comprises the steps: washing Pongamia leaf, neem leaf, cloves, cinnamon, and lemongrass with water, followed by drying and crushing into coarse powder, individually transferring coarse powder in distilled water, followed by subjecting to agitation for 100-150 minutes and allowing to stand for 40-80 minutes to obtain individually Pongamia leaf extract, neem leaf extract, clove extract, cinnamon extract, and lemongrass extract and filtering the extracts using muslin cloth to eliminate solid residues, followed by combining the extracts to obtain plant extract-based seed treatment formulation.

(57) Abstract :

A defatted rice bran-based edible product composition comprises of: i) defatted rice bran powder in a range of 20-30% by weight, ii) multigrain millet flour in a range of 20-30% by weight, iii) wheat flour in a range of 5-15% by weight, iv) sweetening agent in a range of 10-20% by weight, v) butter in a range of 10-20% by weight, and vi) banana peel flour in a range of 5-15% by weight. A method for preparation of the defatted rice bran-based edible product composition, comprising the steps: mixing defatted rice bran powder, multigrain millet flour, wheat flour, sweetening agent, butter, and banana peel powder and obtaining a dough, followed by keeping the dough in freezer at 15-25oC and moulding the dough in the shape of product, followed by baking at a temperature in the range of 120-180oC for 30-60 minutes to obtain the product.

(57) Abstract :

An adaptive splash prevention and drag control system comprises of a mud flap 101 structure positioned above one or more of the tires of a vehicle 102 and extending over the wheel arc, a plurality of active winglets 201 mounted along the mud flap 101, the winglets 201 are operatively connected with the flap 101 by means of an actuator 301, a control unit integrated with the vehicle's Electronic Control Unit (ECU) to dynamically operate the orientation of the winglets 201 by means of the actuator 301 based on real-time weather conditions and braking condition of the vehicle 102, the winglets 201 move downward to direct water spray downward and enhance visibility for following vehicle 102 , and during braking, the winglets 201 move upward to increase aerodynamic drag and downforce, improving braking efficiency and traction.

(57) Abstract :

A tire assessment and maintenance system 100, comprising a housing installed with an inspection unit, including a camera 101 linked to a control unit for determination of defects, an X-ray unit 102 provided with a housing to capture X-ray images of a tire, an analysis module to analyse images for external and internal defects, a touch enabled display unit 103 integrated with housing to display determined defects, a user interface configured to input travel destination and evaluate tire suitability, a multi-coloured lighting elements 104 to indicate suitability, a mobile maintenance unit housed within housing including a material removal module including a hydraulic extenders 110, a buffing unit 113, a articulated telescopic bar 114, an imaging unit 116, and a filling module including a tank 117, a nozzle 118, a swivel application 120, a robotic arm 124, and a curing receptacle 125 to perform complete tire maintenance operations.

(57) Abstract :

A site-specific fertilizer preparation and dispensing device, comprising of a housing 101 installed with a pair of track wheels 102 for movement over an agricultural field, a wedge-shaped plate 103 mounted via a first articulated arm 104, for continuously measuring soil parameters of the field, a compartment 105 stores organic raw materials, a chamber 106 connected to the compartment 105 via hollow passages 107 integrated with iris units 108, to dispense raw materials, a disc 109 having a blade 110 for breaking and mix the raw materials to prepare a uniform high-quality fertilizer, a vessel 111 storing water and microbial solutions, coupled to a sprinkler head 112 with nozzles 113 dispense liquids inside the mixing chamber 106, an imaging unit 114 analyzes tree count and root growth patterns around field, a dispensing nozzle 115 installed with a conduit 116 with multiple outlets 117 dispenses fertilizer directly into targeted root zones.

(57) Abstract :

An autonomous fresh produce vending cart, comprising a cart body 101, multiple motorized wheels 102 for facilitating movement of the cart on the surface, multiple compartments 103 storing and displaying different types of fresh produce, multiple horizontal plates 104 configured for organizing fresh produce and a hydraulic piston arrangement 105 for adjusting angles and positions of compartments 103 relative to cart body 101, multiple motorized air blowers 108 facilitating effective air circulation, a motorized roller 109 rotating on its to unwind a sheet, a Peltier unit for maintaining optimal storage temperature, a conveyor belt assembly 112 facilitate seamless transfer of fresh produce between the two levels, an L-shaped telescopic link 114 is integrated with a C-shaped gripper 115 to pick up fresh produce from either the lower/upper section, multiple extendable L-shaped panels 116 each connected via motorized pivot joints enabling smooth extension and retraction.

(57) Abstract :  
A luggage storage device, comprising of a frame 101 constructed with a platform 102 for storing passenger luggage securely during transit, a speaker 103 and a microphone 104 provides audible instructions, notifications, and facilitate voice command interactions, a suction unit 107 secures the frame 101, multiple clamping units 108 secures the platform 102 to side edges of the vehicle roof, a projection unit 110 attached via a rod 111 and a ball-and-socket joint 112 visually guide and display luggage placement on the platform 102, a series of members 120 equipped with pivot joints 121 lifts and clamps luggage and passengers, a C-shaped unit 123 attached via a hinge 124 to flip over and cover luggage for protection, an inflatable member 125 absorbs shocks and protect luggage during transit, an electromagnet 126 locks the frame 101 securely in place over the luggage.

(57) Abstract :

An autonomous road maintenance device, comprising a body 101 installed with a manual two-ways clamps 102, a chiseling unit 103 mounted on a rotating bar 104, a hydraulic piston 105 to generate controlled reciprocating motion for chiseling operations, a debris storage unit 106 comprising a one-way spring-controlled flap door 107 for automatic debris collection, a binder selection rotary carousel 108 having multiple compartments 109 dispenses a binder via solenoid-controlled valves 110 for binder flow control, a paint carousel 111 with multiple sections 112 containing various paint colors, a rotating brush 113 mounted on a spheroidal joint 114 movable along a horizontal guide rail 115 for smoothing binder application, an air dryer unit 117 for drying of applied binder or paint, a vibratory compactor unit 118 with vertical reciprocating motion for surface compaction levels, a final roller compactor unit 119 for surface leveling and finishing.

(57) Abstract :

A wireless electric vehicle charging system, comprising a battery pack 101 which is enclosed in an enclosure 102 crafted with a plurality of slots 103, multiple cylindrical lithium-ion cells 104 are installed in the slots 103, to provide 350v DC (direct current), a transmitter coil 105 is encased in a stationary pad 106 for integration with a parking space, a receiver coil 301 to establish an inductive coupling with the transmitter coil 105 to wirelessly receive electrical energy for charging of the electric vehicle, a battery management unit continuously monitors voltage, current and temperature of the battery pack 101 to prevent overcharging, deep discharge, and thermal runaway, a thermal regulation unit 201 manages heat produced by the battery pack 101, a digital twin module with a control unit creates a virtual replica of physical assets, to track operational parameters including, temperature, charging rate and efficiency, orientation, one port 203 to enable charging of auxiliary equipment.

(57) Abstract :

An animal sheltering system, comprising an enclosure 101 to house multiple animals, multiple gates 103 enables movement of the animals, two sliding flaps 104 enclosing a hollow region between the flaps 104, multiple cameras 105 determines unruly behaviour displayed by the animals and visitors, a chamber 106 configured with multiple sprayers 107 to spray the animals with a cleaning solution, multiple blowers 109 for drying of the animals, multiple wipers 110 to wipe debris, multiple nozzles 111 spray water, multiple iris holes 112 for drainage of the water into a tank 108, multiple water pots 113 provides drinking water to the animals, multiple trays 115 connected with a compartment 116 provides food to animals, a member 117 attached via a sliding unit 118 wipes waste into channels 119, a digester 120 collects waste for production of biogas, a display panel 124 displays data recorded relating to the animals.

(57) Abstract :  
TITLE: “AN AI-ENHANCED ADAPTIVE PHOTOTHERAPY SYSTEM FOR MANAGEMENT OF NEONATAL JAUNDICE” 7. ABSTRACT The present invention relates to an AI-Enhanced Adaptive Phototherapy System (100) for the effective management of neonatal jaundice. The system integrates an AI-powered phototherapy management module (1) and a control and learning module (2) to personalize treatment by dynamically adjusting light intensity and exposure duration based on real-time, non-invasive sensor data. A monitoring unit (3) tracks bilirubin levels, skin temperature, ambient conditions, and hydration status, while a dynamic LED-based phototherapy unit (4) delivers optimized blue-light therapy. The system further includes a safety and emergency control sub-module (5) for risk mitigation, a user interface and dashboard (6) for real-time interaction and protocol management, and a secure data recording and communication layer (7) to log treatment data for clinical review and research. The invention ensures higher efficacy, reduced side effects, and improved patient safety while enabling energy efficiency and remote accessibility, offering a significant advancement over traditional phototherapy systems. The figure associated with the abstract is Fig. 1 and 2.

(57) Abstract :

**ABSTRACT** The present invention provides a method for preparing a superhydrophobic nano coating for outdoor electrical insulators, wherein amorphous nano-silica is synthesized from fly ash via acid and alkaline treatment and subsequently functionalized using a non-fluorinated silane compound. The process involves neutralizing sodium silicate with concentrated hydrochloric acid to obtain silica gel, which is then modified with dodecyltrimethoxysilane and tetraethoxysilane in the presence of ammonium hydroxide. The functionalized nano-silica is dispersed in chloroform and applied as a spray coating over a polydimethylsiloxane (PDMS)-treated insulator surface. The resulting coating exhibits superhydrophobicity with water contact angles exceeding 150°, and demonstrates enhanced dielectric performance, including reduced leakage current, increased partial discharge inception voltage, and improved tracking resistance under high humidity and polluted conditions. The invention offers an environmentally sustainable and scalable method for enhancing the surface reliability of polymeric, porcelain, and glass-based high-voltage outdoor insulators. Figure 1.

(57) Abstract :

ABSTRACT AN IN-VITRO PROCESS OF QUANTIFYING INFLAMMATION FROM A CO-CULTURE OF CELLS WITH A THERAPEUTIC AGENT The present disclosure relates to a comparative in vitro analysis of a polyphenolic compound. The polyphenol compound is a therapeutic agent and shows anti-inflammatory properties with potential unique benefits for regenerative therapy, improved efficacy through comparative analysis and dose-response evaluation, cost benefits through potentially lower treatment costs, and simplicity in treatment protocols and safety. The present disclosure also relates to an in vitro process of quantifying inflammation from a co-culture of mesenchymal stem cells and fibroblast cell lines.

(57) Abstract :

**ABSTRACT A DUAL-BAND MICROSTRIP PATCH ANTENNA AND A METHOD THEREOF** The present disclosure relates to a dual-band microstrip patch antenna (100) for efficient signal transmission and reception in the X-band (7.85 GHz) and Ku-band (12.65 GHz). The antenna (100) comprises a substrate layer (102), a radiating patch (104), a rectangular feed line (106), a ground plane (108), an impedance matching network (110), and an RF signal processing module (112). The substrate layer (102) is made of a mineral-epoxy composite with a low loss tangent to reduce signal attenuation. The radiating patch (104), configurable in various shapes, enhances electromagnetic performance. The impedance matching network (110) ensures low return losses. The antenna (100) integrates with a wireless communication system (300) comprising a signal processing unit (302), transceiver module (304), power amplifier (306), and adaptive frequency tuning (308). Optimized using Finite-Difference Time-Domain (FDTD) simulations, it is ideal for satellite communication, radar, and wireless applications.

(57) Abstract :  
ABSTRACT A COMPOSITE MATERIAL AND A METHOD OF FABRICATION THEREOF The present disclosure relates to a composite material (100) structure for use in modular and structural applications. The composite material (100) comprises a thermosetting polymeric matrix (102) forming a continuous phase, and a filler phase of powdered polyethylene terephthalate (PET) (104) homogeneously dispersed within the matrix (102) in a predefined ratio. The composite material (100) is prepared by subjecting the polymeric matrix (102) and PET (104) powder to mechanical stirring at a predefined rotational speed to achieve uniform dispersion. The resulting mixture is manually laminated using a lay-up technique onto a mold surface and subsequently cured under ambient temperature conditions. The process results in a rigid, solidified composite material (100) exhibiting mechanical integrity, dimensional stability, and environmental sustainability, making it suitable for load-bearing and modular construction applications.

(57) Abstract :  
This invention discloses a method for optimized resource allocation in distributed cloud systems using a Genetic Algorithm (GA)-based framework. The method dynamically allocates computational workloads across heterogeneous nodes in a cloud infrastructure, improving efficiency, scalability, and service quality. Each solution candidate (chromosome) represents a specific assignment of tasks to virtual machines or containers, taking into account constraints such as CPU, memory, bandwidth, and latency. The GA process includes population initialization, fitness evaluation, selection, crossover, and mutation operations. A multi-objective fitness function is employed to balance resource utilization, energy efficiency, latency, and service-level agreement (SLA) compliance. The invention enhances traditional GAs with adaptive mutation strategies, domain-specific encoding, and predictive analytics to forecast workload trends and guide the search process. Furthermore, the system features hierarchical deployment, with localized optimization at edge nodes and global coordination through a central controller. Fault tolerance and SLA maintenance are ensured via dynamic reallocation in the event of node failures or performance degradation. The method is designed to integrate with existing cloud orchestration tools such as Kubernetes and supports real-time resource orchestration through API endpoints. Simulation results demonstrate substantial improvements in resource utilization, task latency, and energy savings compared to conventional allocation strategies. This invention offers a robust, intelligent, and scalable solution for managing dynamic workloads in distributed cloud environments using genetic algorithm principles tailored for modern computing demands.

(57) Abstract :

The present invention discloses a system and method ("Suchak") for measuring the liquid level in an overhead tank. A pressure sensor (101), installed at a tap via a T-joint (102), detects liquid pressure. A microcontroller (103) processes the sensor's signals using a novel algorithm. This algorithm employs a Slow Moving Average (SMA) whose output is compared against the raw pressure value (P) to identify and discard transient spikes caused by tap usage. A Fast Moving Average (FMA) then smooths the corrected signal to remove sensor noise, yielding an accurate static pressure. This static pressure is converted to height and then to a calibrated percentage liquid level (0-100%), which is displayed on a graphical user interface (GUI) of an electronic display (104). The system is non-intrusive, cost-effective, and provides continuous, accurate readings by compensating for tap-induced pressure fluctuations. Its principal use is in household water management.

(57) Abstract :

ABSTRACT: This invention introduces an extended play fair cipher for enhancing security of cryptography systems. Traditional ciphers are criticized as easy victims of cryptanalysis as they are too simple and continue to remain as educational tools. But their inherent simplicity as a spin-off can be made use of in computing session keys for applications which require a moderate level of security. Extending the key matrix of the Playfair cipher to have yet another dimensionality improves the key space with one of the plaintext symbols in the considered trigram for encryption serving as an index to a transposed key matrix that will be employed in the substitution process. The Key matrix can also be scaled based on the character set from which the plaintext is derived. This invention can come handy as to be employed in lower end devices where a trade-off is required between level of security and computational complexity

(57) Abstract :

ABSTRACT TITLE: IN VITRO STUDIES ON ANTINEOPLASTIC PROPERTIES OF FORTIFIED POLYHERBAL FORMULATIONS. Cancer is a major health problem worldwide. Herbal formulations have been traditionally used for their medicinal properties, and recent studies have highlighted their potential in cancer treatment and liver protection. This review focuses on the anti-cancer and hepato-protective activities of polyherbal formulations in vitro. There is a need for better and safer treatments. Herbal medicines contain natural compounds that may help fight cancer. In this study, we tested fortified polyherbal (Phyllanthus emblica, Terminalia bel/irica, Terminalia chebula and herbs as additives) formulations made from different medicinal plants. These herbs were chosen for their known ability to kill cancer cells, reduce inflammation, and act as antioxidants. Natural enhancers were also added to increase their effectiveness. We tested the formulations on different human cancer cell lines and compared the results with normal cells. The tests used were Mn' and Trypan Blue assays. The formulations reduced cancer cell growth in a dose-dependent way and showed little harm to normal cells. They also caused cancer cells to die and stopped them from dividing by blocking the cell cycle. These results show that fortified polyherbal formulations may be useful in cancer treatment. Future research on herbal formulations should investigate their molecular mechanisms, safety, and efficacy through in vivo studies, clinical trials, and standardization to ensure their potential as anti-cancer and liver-protective agents.

(57) Abstract :  
Abstract The present invention discloses an AI-powered system for the identification, authentication, and ordering of Geographical Indication (GI)-tagged handloom fabrics using computer vision and machine learning techniques. The system captures fabric images, processes them using advanced image analysis, and extracts key features such as weave patterns, textures, and color schemes. A trained AI model then classifies the fabric against a certified database of GI-tagged textiles, ensuring authenticity verification. Additionally, the system integrates an e-commerce platform for seamless transactions with verified sellers. This innovation enhances efficiency, prevents counterfeiting, and promotes fair trade practices in the handloom industry.

(57) Abstract :

Abstract: A novel framework for Intelligent English Language Processing (IELP) designed for autonomous robots is presented in this research in an effort to provide more intuitive and natural human-robot interaction. Our approach combines emotion identification, context-aware cognitive modelling, and sophisticated natural language understanding to enable smooth, sympathetic, and situation-appropriate communication. The suggested architecture allows robots to understand not only the literal meaning of spoken English but also the speaker's emotional state and the subtleties of the conversation by fusing transformer-based language models with real-time sensory data processing. The robot can make contextually sound decisions, flexibly adjust its behaviour, and deduce user intent thanks to a cognitive reasoning module. Simultaneously, an emotion recognition system uses multimodal inputs, including textual sentiment, facial expressions, and speech tone, to sympathetically adjust the robot's answers. Significant gains in answer relevance, emotional appropriateness, and user pleasure are shown in experiments conducted in human-robot interaction scenarios. The findings highlight how IELP systems can develop socially intelligent robotics and open the door to more efficient and human-centered AI implementations.

(57) Abstract :

Abstract: With their transformative potential in the realm of literacy instruction, Graph Neural Networks (GNNs) have grown into a potent paradigm for representing complicated, relational data. The use and effects of GNNs in improving writing assistance, discourse analysis, tailored learning, and reading comprehension are examined in this work. ·GNNs facilitate multi-level reasoning that reflects human comprehension by expressing linguistics and intellectual information as structured graphs, where nodes represent concepts, phrases, or learners and edges record semantics, syntactic, or behavioral correlations. We examine recent studies that combine GNNs with knowledge graphs, discourse structures, and student modeling, emphasizing how they enhance adaptive feedback systems, text summarization, and narrative comprehension. Notwithstanding issues with comprehension, data sparsity, and computing requirements, GNNs present encouraging paths for the advancement of tailored and fair literacy training.

(57) Abstract :

Abstract: In order for robots to comprehend the logical elements and connections found in texts, argument structure analysis is a crucial task in natural language processing. This study combines text segmentation, component identification, relation extraction, and graph-based modelling to provide an efficient method for analysing argument structure. The method promotes deeper thinking over speech and improves applications like intelligent tutoring systems, opinion mining, and automated essay grading by portraying arguments as structured graphs of assertions, premises, and counterarguments. The suggested approach enhances the precision and interpretability of text analysis by utilizing cutting-edge machine learning techniques, such as Graph Neural Networks, to capture intricate argumentation relationships. Potential solutions are addressed, along with issues like insufficient annotated data and ambiguity in argument components.

(57) Abstract :  
This research develops a novel surface plasmon resonance (SPR) sensor based on a BK7/Silver (Ag)/Aluminum Phosphate ([AlPO]<sub>4</sub>)/2D materials structure for the detection of various chemicals. Employing angular interrogation method, we numerically evaluate the performance at the wavelength of 633 nm. These materials have been selected due to their better optical and electrical properties, i.e., their complex refractive indices since these characteristics play a key role in the SPR response. [AlPO]<sub>4</sub> enhances the coupling between the plasmonic metal (Ag) and the 2D materials, hence the sensor performance. Knowledge in the utilization of these materials and their characteristics, the proposed sensor demonstrates improved sensitivity and accuracy and senses various chemicals for various uses. Our proposed sensor exhibits a maximum sensitivity of 432.0697°/RIU, a quality factor (QF) of 173.4662 RIU<sup>-1</sup>, and a detection accuracy (DA) of 0.7459 through the detection of various chemical samples, demonstrating excellent improvements over existing methodologies.

(57) Abstract :

The present invention relates to a superhydrophobic lanthanum cerate oxide coating with an atmospheric plasma spray. Initially, lanthanum cerate oxide (La<sub>2</sub>Ce<sub>2</sub>O<sub>7</sub>) powder is spray dried for obtaining round or spherical shaped agglomerates of a predetermined particle size. Round or spherical agglomerates of lanthanum cerate oxide (La<sub>2</sub>Ce<sub>2</sub>O<sub>7</sub>) powder is fed to a powder feeder of an atmospheric plasma spray apparatus having a plasma gun that involves a primary gas and a secondary gas. The powder was plasma sprayed on the substrate at optimized process conditions to obtain the superhydrophobic lanthanum cerate oxide coating. Reference Figure 2

(57) Abstract :  
VISCOELASTIC FLUID-MEDIATED NANOPORE-BASED MEMRISTIVE DEVICE Provided is a viscoelastic fluid-mediated nanopore-based memristor device (200). The memristor device (200) comprises a silicon chip (110) including an open region. Further, the memristor device (200) comprises an ultra-thin dielectric material membrane (112) that covers entire surface of the silicon chip (110) and forms a suspended region. A nanopore (102) is fabricated within and entirely through the ultra-thin dielectric material membrane (112) at any position within the suspended region. Furthermore, the memristor device (200) comprises a chip holder (208) adapted to hold the silicon chip (110) and a pair of electrolyte reservoirs (204) incorporated on either side of the chip holder (208). The pair of electrolyte reservoirs (204) contains electrolyte fluid that exhibits viscoelastic properties. The pair of electrolyte reservoirs (204) is only connected through the nanopore (102). A pair of electrodes acts as end terminals attached to the pair of electrolyte reservoirs (204). Figure 2

(57) Abstract :

A METHOD FOR CONVERSION OF CARBON DIOXIDE TO METHANOL, FORMIC ACID AND OTHER ORGANIC COMPOUNDS Provided is a selective hydroboration of CO<sub>2</sub> to either boryl formate (HCOOBR<sub>2</sub>) or methoxy borane (CH<sub>3</sub>OBR<sub>2</sub>) in >97% yield catalyzed by the commercially available catalysts such as dialkyl, diaryl or alkyl-aryl sulfoxide/sulfide/sulfone in presence or absence of solvents such as THF or toluene. These oxyboranes are subsequently hydrolyzed to give methanol and formic acid in excellent yields under ambient temperature. In addition, this reaction system also catalyses the N-formylation, N-methylation of amines, N-hydroxymethylation of carbazoles and indoles, and C-methylenation of indoles using CO<sub>2</sub> as C1 source. Furthermore, N-hydroxymethylated carbazole was coupled with indole at C3 position to gave C-N coupled products. The present method is highly effective for economically producing methanol and formic acid from CO<sub>2</sub>, providing a viable solution for reducing atmospheric CO<sub>2</sub> levels that contribute to global warming. (57) Abstract :  
LOW-TEMPERATURE PROCESS FOR RECOVERY OF ALUMINA FROM DIFFERENT SOURCES The present invention relates to a low-temperature method of recovery of alumina from various alumina-containing resources. The method comprises the steps of treating an alumina-containing resource with Sodium Hydroxide (NaOH) at a predefined low temperature in presence of water (5-50%), and leaching the treated alumina-containing resource with hot water to dissolve Sodium Aluminate (NaAlO2) and produce leachate. The method further comprises causing precipitation of Aluminium Hydroxide (Al(OH)3) by reacting the leachate with CO2 so as to convert the Sodium Aluminate (NaAlO2) to Aluminium Hydroxide (Al(OH)3). The method includes performing filtration for effectively separating the solid residues from the leachate; and performing calcination of the precipitated Aluminium Hydroxide (Al(OH)3) at a pre-defined temperature to obtain alumina. Further, the sodium carbonate solution is treated with lime/slaked lime to regenerate sodium hydroxide. Figure 1

(57) Abstract :

Abstract Title: 3D printed bioactive glass reinforced magnesium as bone analogue and application thereof Magnesium and its alloys have gained significant attention as materials for orthopedic implants due to their bioactivity and compatible mechanical properties similar to natural bone. Achieving an optimal balance between mechanical strength and degradation rate in vivo is crucial for ensuring the implant with adequate support during healing without affecting surrounding tissues. Bioactive glass has gained popularity for faster bone and soft tissue bonding; but it has limited application under load bearing condition. Therefore, current innovation is the development of bioactive metal-ceramic composite for biomedical implantation. The melt-quenched amorphous 3D printed bioglass network is reinforced with magnesium matrix via combination of additive manufacturing and powder metallurgy route. Change in the magnesium infiltration within the composite can modulate the mechanical properties, rate of corrosion under in vivo implantation which could lead to application based on loading direction and site specific orthopaedic application. (57) Abstract :  
ABSTRACT A METHOD FOR AMBIENT AMMONIA SYNTHESIS FROM NITROGEN USING NANO CARBON BASED CATALYST Aspects of present disclosure relate to a method for ambient ammonia synthesis from nitrogen using nano carbon based catalyst. The present invention integrates elements of both approaches to enable ammonia production under ambient conditions using carbon source such as Nitrogen doped Coal Carbon (N-CC) and ferrous hydroxide, which mimic the roles of apoproteins and metal centers in nitrogenase. The method employs proton-coupled electron transfer, with metallic iron supplying electrons and sustaining catalytic activity. The heterogeneous catalyst assembly was developed that enables ammonia synthesis under ambient conditions. Ammonia formation is validated through titrimetric analysis, XPS characterization, 1H NMR spectroscopy, and XRD analysis of NH4Cl. Structural investigations confirm nitrogen incorporation, with TEM imaging revealing favorable morphological features for catalytic performance. The method is capable of producing a maximum yield of ~37mM of NH3. This approach provides a promising, sustainable alternative for ammonia synthesis without the need for high temperatures or pressures. (Figure 1 shall be reference figure)

(57) Abstract :

Disclosed herein a method of producing few-layer-graphene (FLG); comprising (a) feeding graphite blocks into a graphite delamination apparatus to apply shearing force, comprising a rotatable plate with an axle; (b) rotating the rotatable plate of the graphite delamination apparatus at 1000 to 5000 rpm by means of a rotating means; (c) peeling/ delaminating the graphite block under the shearing force induced by the apparatus and obtaining nano-SGPs. The present invention further discloses a system for producing few-layer-graphene (FLG). Figure 1

(57) Abstract :

The machine takes hardly two minute to peel the pineapple. The machine can peel 8 pineapples in just two minutes. 4 pineapples in the upper disc and 4 pineapples in the lower disc. The same machine can be used as skinning machine as well as peeling machine. Skinning means smoothening of outer surface. For this adjustment of cutter is not required. Increasing and decreasing the time of processing peeling and skinning respectively could be achieved. No manual navigation is required while peeling. One can see the peeling process very clearly. It is open. The operator can see the pineapple while peeling.

(57) Abstract :

ABSTRACT SOLAR-POWERED MULTIPURPOSE SYSTEM FOR PRE-COOLING, DISINFECTION, AND LOW-TEMPERATURE STORAGE The present invention relates to a solar-powered multipurpose processing system (100) for field-level pre-cooling, disinfection, and low-temperature storage of fresh produce. The system comprises a vapour compression refrigeration system (1), a cold thermal energy storage structure (2), a hydro-cooler cum disinfection unit (6), and low-temperature storage cabinets (10). Solar photovoltaic energy powers the refrigeration system (1), which cools water in the insulated storage tank (2), forming an ice bank. This stored thermal energy is circulated via a stainless-steel heat exchanger (4) using a DC water pump (9) to chill and disinfect water in the hydro-cooler (6). The system also supports storage of produce at controlled temperatures using flexible insulated pipes (5), evaporator coils, and fans powered through a small battery backup. A temperature controller (7) regulates cooling cycles for both hydro-cooling and storage units, ensuring effective temperature maintenance without grid electricity. The invention enables faster, energy-efficient preservation in off-grid rural environments.

(57) Abstract :

The present invention relates to a system and method for collecting and analyzing audience feedback in movie theatres by integrating audio reviews with facial expression analysis. The system consists of a movie review counter installed at theatre exits, where audience members provide spoken feedback while their facial expressions are captured. The collected audio is converted to text using Automatic Speech Recognition (ASR), and Natural Language Processing (NLP) is applied to extract sentiment and key themes. Simultaneously, facial expression analysis is conducted using computer vision techniques to classify emotions such as happiness, sadness, surprise, and neutrality. A sentiment analysis module integrates both text-based sentiment and facial emotion data to derive a comprehensive audience sentiment score. The processed data is aggregated and analyzed to generate insightful reports for filmmakers and distributors, providing detailed emotional trends and audience reactions. The system operates in compliance with privacy regulations, ensuring anonymized data collection and secure storage. This innovative approach enhances traditional movie review systems by capturing real-time, unbiased emotional responses, leading to improved content creation and marketing strategies.

(57) Abstract :

ABSTRACT AN ANTI-CANCER TRIMETALLIC NANO COMPOSITION AND A METHOD OF PREPARATION THEREOF The present invention relates to trimetallic nano composition derived by using plant extract and method its method of preparation. Said tri-metallic nano composition comprises 55.04% of Cu (w/w), 10.75% of Zn (w/w) and 34.19% of Pt (w/w). The synthesized trimetallic nano composition exhibits significant antioxidant activity by using DPPH method and antimicrobial efficacy against tested various pathogens. Additionally, the anticancer activity of the synthesized trimetallic nano composition is also evaluated. By using plant extract, the present invention provides an eco-friendly, sustainable and non-toxic method for the synthesis of trimetallic composition.

(57) Abstract :

Abstract A multi-lingual legal assistant [0026] The present invention discloses a legal assistant (100) capable of generating legal responses based on multi-lingual user input. The present invention is such that the legal assistant (100) is trained using large language models on a plurality of Indian legal textbooks and a plurality of case judgments from the Supreme Court of India to create a plurality of topics and its corresponding pluralities of query-response pairs. On receiving a freeform legal query from user, the legal assistant (100) translates the freeform query into its English equivalent query, retrieves a plurality of lexically similar and semantically similar responses, and feeds them into a large language model as context to generate a context-aware final response. (57) Abstract :  
The present invention relates to a system (100) and a method for assessing the fair distribution of green open space equity in a city. The system (100) includes a data collection module (101) that gathers ward-wise information on green space parameters availability, accessibility, and quality and demographic factors such as ward area and population density. An analysis module (102) processes this data using correlation and regression tools at both ward and city levels to identify relationships and spatial patterns. An output module (103) evaluates green space equity by comparing the analysis results against predefined thresholds, determining whether the distribution is fair and meets quality standards. This approach enables objective, data-driven assessment to support equitable urban planning and promote balanced access to green spaces for all city residents. (to be published with figure 1)

(57) Abstract :  
The present invention relates to a fractional-order closed-loop control system (10) for optimizing the scheduling of chemotherapy treatments. The system comprises a controller (1) that receives a reference drug concentration input and output drug concentration feedback, and generates an appropriate control signal. A drug infusion pump (2), connected to the controller (1), delivers the appropriate drug dosage based on this control signal. A cancer patient model (3) is coupled with the drug infusion pump (2), simulates the dynamic response of the patient to the infused chemotherapy drug and provides the corresponding output drug concentration. The sensor (4) continuously monitors this output and feeds it back to the controller (1), completing the closed-loop system. The fractional-order control system(10) ensures precise drug delivery, robust tracking of target drug levels, and improved clinical outcomes by reducing cancerous cells with minimal impact on healthy cells.

(57) Abstract :

ABSTRACT TITLE: Nanostructured Si-void-C yolk/shell architecture: a high-performance Li-ion battery anode and the preparation method thereof Nanostructures and nanostructured silicon anodes are provided with the aim to enhance the electrochemical performance and applications in Lithium-ion batteries (LIBs). In this regard, a straightforward approach for the fabrication of Si@C core-shell and Si@void@C yolk-shell structures are provided. The electrochemical performance of Si@C and Si@void@C electrodes were examined in a Li-ion half-cell using 2032 coin-cell configuration through cyclic voltammetry, galvanostatic discharge-charge measurements, rate performance assessments, and electrochemical impedance spectroscopy (EIS), revealing a notably superior electrochemical performance. (57) Abstract :

The present invention relates to an integrated wood-based fireplace, stove, cum water heating system (100) for vernacular rural housing, integrating space heating, cooking, and water heating in one unit. The system (100) comprises a combustion chamber (101) with a fireplace (105) having an openable window (106) for loading wood or biomass fuel, an external air inlet pipe (107), and an ash box (108). A heat exchanger hot water tank (102) is in thermal contact with said chamber (101) and includes a cold-water inlet (109), steam outlet (110), and hot water outlet (111). An insulated casing (103) encloses said chamber (101) and features a chimney or flue (112) for venting gases. A stove surface (104) above chamber (101) allows cooking. Further, manual control of fuel and airflow optimizes efficiency. The system (100) provides a low-cost, sustainable solution for rural areas, improving health, comfort, and energy access without relying on grid infrastructure.

(57) Abstract :

ABSTRACT IOT-BASED PORTABLE SOLAR MICRO IRRIGATION APPARATUS The present invention provides an IoT-based portable solar micro irrigation apparatus including a motor housing (101) containing a brushless DC motor, an impeller (107) connected to the brushless DC motor, and a volute (108) housing the impeller (107) and configured to direct water flow from the impeller (107) to a discharge outlet. The apparatus includes a detachable pump filter (109) providing a mesh barrier to prevent debris from entering the apparatus and a pump bottom cage (110) providing structural support for the detachable pump filter (109). The apparatus includes an embedded microcontroller-based IoT controller to process input from soil moisture sensors, temperature sensors, and humidity sensors, a handle (105) attached to the motor housing (101) for manual transportation, and a solar power input configured to operate the brushless DC motor directly without battery storage through a maximum power point tracking controller. (57) Abstract :

ABSTRACT The present invention relates to a novel intracanal medicament for endodontic therapy comprising a combination of calcium hydroxide and placenta extract in a biocompatible carrier such as glycerin or propylene glycol. The composition exhibits potent antimicrobial activity, especially against Enterococcus faecalis, and promotes tissue regeneration and periapical healing due to the presence of bioactive placental factors. The medicament is especially suitable for cases of persistent periapical pathology, regenerative endodontic procedures, and necrotic immature teeth. It addresses the limitations of current medicaments like Triple Antibiotic Paste by avoiding tooth discoloration and enhancing biological healing.

(57) Abstract :

[036] The present invention discloses a voice-activated legal advisory system designed to provide real-time, hands-free legal assistance during emergency situations such as unlawful detentions, harassment, domestic violence, or roadside encounters. Leveraging advanced speech recognition, natural language processing, and context-aware detection through sensors like GPS and audio classifiers, the system delivers jurisdiction-specific legal guidance in response to verbal commands or automatically detected distress conditions. The invention includes secure, timestamped audio recording features for evidence preservation and enables encrypted communication with emergency contacts or legal entities. Deployable across smartphones, wearables, and vehicle systems, and operable in multilingual and offline modes, the invention bridges the gap between immediate legal need and access to counsel, empowering individuals to understand and assert their rights effectively during moments of vulnerability. (57) Abstract :

[039] The present invention discloses a privacy-preserving, real-time emotion recognition system designed to operate entirely on edge devices without transmitting raw user data to centralized servers. Utilizing multimodal inputs—including visual, auditory, and physiological signals—the system performs on-device signal preprocessing, feature extraction, and emotion classification using compressed deep learning models. It incorporates user-specific personalization through local adaptation, federated learning for collaborative model improvement without compromising privacy, and an explainability module to generate interpretable emotional insights. The invention functions in both online and offline modes, ensuring robust performance in low-connectivity environments. Its modular design enables scalable deployment across smartphones, wearables, automotive systems, and embedded IoT platforms, providing a secure, adaptive, and ethically grounded solution for emotion-aware applications. (57) Abstract :  
[034] The invention discloses a Smart Vehicle Safety System utilizing IoT and facial emotion recognition to prevent unsafe driving conditions. The system integrates an ESP32 microcontroller with modules for emotion detection via ESP32-CAM, alcohol sensing using an MQ-3 sensor, helmet verification through RFID or computer vision, and crash detection using an MPU6050 accelerometer. Upon identifying unsafe conditions—such as driver fatigue, emotional distress, alcohol influence, or absence of a helmet—the system disables vehicle ignition using a relay mechanism. Additionally, in the event of an accident, the system automatically captures real-time GPS coordinates and sends emergency alerts via SMS using a GSM module. The modular and cost-effective design allows retrofitting into existing two-wheelers and small vehicles, enhancing driver safety through proactive monitoring and automated emergency response. (57) Abstract :  
[040] The present invention discloses a smart irrigation management system that integrates soil moisture sensors, microcontroller-controlled irrigation, and blockchain technology to automate and transparently record irrigation events. The system monitors real-time soil moisture levels and activates water flow through solenoid valves when thresholds are breached, ensuring efficient water usage. Each irrigation event is immutably logged on a blockchain ledger with timestamp, sensor data, and zone information, enabling tamper-proof auditing and traceability. A user dashboard provides access to live and historical data, supporting informed decision-making and compliance with water management standards. The invention enhances sustainable agriculture by reducing water waste, increasing crop productivity, and enabling secure, data-driven farm operations. Accompanied Drawing [FIGS. 1-2]

(57) Abstract :

[041] The present invention relates to an AI-powered mist cooling and pollution control system designed for urban traffic signals. The system autonomously activates a water mist spray when ambient temperatures exceed a predefined threshold, typically 35°C, to reduce heat stress experienced by pedestrians, two-wheeler riders, and traffic personnel. It utilizes an ESP32 microcontroller in conjunction with temperature and water level sensors to monitor conditions and control operations. A buzzer alerts maintenance staff when the water tank is low, ensuring continuous functionality. The system operates using a hybrid renewable energy setup consisting of solar panels and wind turbines, eliminating dependency on external power sources. Compact, low-maintenance, and easy to install within existing traffic infrastructure, the invention promotes public comfort, pollution control, and sustainable urban development. (57) Abstract :

[033] This invention relates to a novel dual pH- and thermo-responsive amphiphilic block copolymer drug delivery vehicle synthesized via RAFT polymerization using phenylalanine derivatives and N-vinylcaprolactam. The copolymer self-assembles into micellar nanostructures capable of encapsulating hydrophobic anticancer drugs such as Doxorubicin with high loading efficiency. The micelles exhibit controlled drug release triggered by acidic pH and elevated temperature conditions typical of tumor microenvironments, enabling targeted cancer therapy. In vitro studies demonstrate the biocompatibility of the polymer and enhanced cytotoxicity of the drug-loaded micelles against cancer cells under hyperthermic conditions, highlighting the potential of this system as an effective and safe drug delivery platform for cancer treatment. (57) Abstract :  
[038] The invention discloses a decentralized system for the secure storage, verification, and retrieval of legal documents using blockchain technology. By combining immutable blockchain ledgers with encrypted off-chain storage, the system ensures the integrity, confidentiality, and authenticity of legal records such as contracts, certificates, and court judgments. Smart contracts automate access control and document validation, enabling authorized users to securely upload, verify, and audit documents without reliance on central authorities. This innovative framework addresses prevalent issues of document forgery, unauthorized modifications, and inefficient verification, offering a scalable, transparent, and tamper-proof solution adaptable to multiple jurisdictions and legal sectors. (57) Abstract :

[032] The invention discloses a low-cost, energy-efficient electro-chlorination reactor for onsite drinking water disinfection using naturally occurring chloride ions in tap water. The system comprises a rectangular poly(methyl methacrylate) cell equipped with six cylindrical graphite anodes and six stainless steel cathodes arranged alternately with optimized spacing and overlap to enhance electrochemical efficiency. Operating at a low current density of 1.5 mA/cm<sup>2</sup>, the reactor generates up to 2.5 mg/L of active chlorine with minimal energy consumption (0.083 kWh/m<sup>3</sup>) and without altering the pH of the treated water. The use of inexpensive, stable electrode materials and the reactor's simple, scalable design make it particularly suited for decentralized, rural, and resource-limited water treatment applications. (57) Abstract :

[036] The present invention relates to a green and sustainable method for the synthesis of 2-amino-3,5-dicarbonitrile-6-arylthio-pyridine derivatives using a novel, reusable glass-ceramic heterogeneous catalyst in water medium. The catalyst is prepared via a melt-quenching and controlled crystallization process involving metal and non-metallic oxides. This glass-ceramic material exhibits both Lewis acidic and basic properties, enabling efficient catalysis of a one-pot, three-component reaction involving 4-methoxybenzaldehyde, 4-bromothiophenol, and malononitrile. The process achieves a high product yield (>90%) at 100°C and eliminates the need for hazardous solvents or expensive reagents. The catalyst can be reused for multiple cycles without significant loss of activity, offering a cost-effective and eco-friendly alternative for the synthesis of bioactive pyridine derivatives with potential pharmaceutical applications. (57) Abstract :

[047] The present invention, titled Agrobot: Smart Agriculture Robot, discloses an intelligent and automated agricultural system that integrates IoT-based environmental sensing, AI-driven plant disease detection, voice command functionality, GPS-based field mapping, and real-time mobile communication. Utilizing a low-cost microcontroller (ESP32-WROOM), the system automates irrigation and fertilization based on live sensor inputs, significantly reducing water and resource wastage. A mobile application enables farmers to monitor field conditions, control operations, and upload leaf images for disease diagnosis using deep learning models trained on open datasets. Voice interaction and WhatsApp alerts ensure accessibility for semi-literate and remote users. The modular, scalable architecture supports cloud data storage, enabling informed decision-making and future enhancements. The invention provides a cost-effective, user-friendly solution to improve crop health, boost productivity, and promote sustainable farming practices. Accompanied Drawing [FIGS. 1-2]

(57) Abstract :  
[039] The present invention relates to an integrated geolocation and smart booking system for optimizing electric vehicle (EV) charging networks. The system utilizes geospatial analysis, machine learning algorithms, and real-time traffic and energy data to identify optimal locations for EV charging station deployment. It includes a user-friendly interface for real-time slot booking, categorized by vehicle type and charging mode, with availability indicators and time-based session tracking. A dynamic pricing engine differentiates rates based on user history and demand periods, while an analytics dashboard provides insights into energy consumption, session history, and environmental impact. The invention enhances charging accessibility, reduces congestion, and supports scalable, sustainable urban mobility. Accompanied Drawing [FIGS. 1-2]

(57) Abstract :

[032] The present invention relates to a biodegradable composite packaging film and a method for its preparation using naturally derived materials—sodium alginate, chitosan, and aqueous extracts of Albizia lebbeck, an indigenous plant. The film is fabricated using a layer-by-layer casting technique wherein the first layer comprises sodium alginate and Albizia lebbeck extract with glycerol as a plasticizer, and the second layer comprises chitosan dissolved in acetic acid with polyvinyl alcohol. The resulting film demonstrates superior mechanical strength, flexibility, antimicrobial activity, and barrier properties. It is fully biodegradable under composting or soil conditions and decomposes without releasing harmful residues. This invention offers an eco-friendly, cost-effective, and scalable alternative to synthetic plastic packaging and is particularly suitable for applications in food packaging, agriculture, and medical disposables. (57) Abstract :

[031] The present invention relates to a novel class of core- and bay-substituted thionated arylene diimide compounds, including naphthalene diimide (NDI) and perylene diimide (PDI) derivatives, in which one or more oxygen atoms at the imide positions are replaced with sulfur atoms to enhance radical anion formation and stability. These compounds, synthesized using Lawesson's reagent under controlled conditions, are categorized into four classes based on substitution patterns and degree of thionation. The resulting radical anions exhibit tunable optical properties with red-shifted absorption and persistent visible coloration, and their half-lives are significantly enhanced by increasing sulfur content and electronic modifications at the core or bay regions. This invention demonstrates, for the first time, stable radical anions from such substituted thionated structures and offers promising utility in redox catalysis, near-infrared (NIR) absorption, organic electronics, and self-assembled nanomaterials. Accompanied Drawing [FIGS. 1-2]

(57) Abstract :  
The present invention relates to a system and a method (200) for remote vital signs monitoring, specifically detecting heartbeat and breathing rates. The system comprises a vector network analyser (VNA) coupled with an external stepped-frequency continuous wave (SFCW) radar that transmits a dynamically adaptable frequency sweep to a CPW-fed UWB wearable antenna sensor (100) placed on the user's wrist. The wearable antenna sensor (100) radiates signals toward the human body and captures reflected signals containing both useful and unwanted components, such as micro-Doppler signals and stationary body responses. The received signals are processed by the VNA using an Inverse Fast Fourier Transform (IFFT) module for target detection and a Range-Doppler (R-D) processing module for extracting heartbeat and breathing signatures. Motion Target Indicator (MTI) filtering is applied to eliminate noise and stationary responses, ensuring accurate detection of vital signs. This system provides an efficient and non-invasive approach for early cardiopulmonary disease diagnosis and monitoring. (to be published with figure 2)

(57) Abstract :

The present invention relates to a novel bifunctional Formyl-amination equivalent reagent, a process for the preparation thereof. This invention further relates to the characterization of the new organic compound (D), and its application to the synthesis of 1,3-iminoacetal/ $\beta$ -amino aldehydes by reaction with various types of olefins via simultaneous generation of N- and diethoxymethane-centred radicals when subjected to visible-light-mediated photocatalysis.

(57) Abstract :

The present invention relates to a system (100) and method (200) for managing construction claims efficiently within a Building Information Modeling (BIM) environment. Traditional claim processes are often fragmented, manual, and prone to delays. This invention offers an integrated solution that automates claim identification, documentation, validation, and resolution. The system (100) includes an analysis module (101) to detect project issues and identify impacted BIM elements, which are linked to structured digital claim forms. A visualization and reporting module (103) generates 3D views and automated reports to clearly present claim details. A contract clause validation module (104) checks claim data against relevant clauses, maintaining traceable records. A resolution module (105) supports real-time collaboration among stakeholders to review, decide, and update claim statuses within the BIM model. By unifying these processes, the system (100) enhances transparency, reduces errors, and speeds up claim resolution in construction projects. (to be published with figure 1)

(57) Abstract :  
“EtherVox: Blockchain-Based Electronic Voting System with Dual-Layer Authentication and Smart Contract Automation ” Traditional voting systems suffer from critical vulnerabilities including centralized points of failure, susceptibility to cyberattacks and fraud, lack of transparency in vote counting processes, high operational costs, privacy concerns, and limited accessibility for geographically dispersed or mobility-constrained voters. To address these fundamental challenges, we present EtherVox, a revolutionary decentralized voting platform that leverages Ethereum blockchain technology and smart contracts to establish a secure, transparent, and tamper-resistant electoral framework. The system integrates a React.js frontend with Tailwind CSS for an intuitive user interface, a Node.js/Express.js backend for API orchestration, and Solidity-based smart contracts to automate vote validation, timestamping, and immutable storage on the blockchain. Key innovations include a dual-layer authentication mechanism combining MetaMask wallet signatures with government-ID hashing to prevent fraud and ensure one-vote-per-identity compliance, Merkle tree-based voter roll verification that reduces on-chain computation costs by 52%, and IPFS integration for decentralized off-chain data storage to minimize network congestion and gas costs. The system employs MySQL for secure voter registration and election logistics, coupled with Web3.js and Ethers.js libraries for seamless blockchain interaction. Comprehensive testing on Ganache and Ethereum testnets demonstrated exceptional performance with 99.5% transaction success rates, sub-3-second latency, and 45% reduced gas costs through optimized contract logic. Security audits via MythX validated the system's resistance to common attack vectors including reentrancy and frontrunning attacks. EtherVox enhances voter accessibility through QR-code ballot tracking for remote verification and real-time dashboards for transparent result monitoring, while its modular architecture supports future integration with Layer-2 solutions for cross-chain scalability. The platform successfully addresses privacy concerns through advanced cryptographic techniques that decouple voter identities from their ballots using Merkle-tree verification and zero-knowledge proofs, ensuring confidentiality while maintaining complete auditability. By merging cryptographic rigor with user-centric design principles, EtherVox offers governments and electoral organizations a cost-efficient, auditable, and highly scalable alternative to legacy voting infrastructure, potentially transforming democratic processes through enhanced security, transparency, and accessibility while eliminating traditional vulnerabilities associated with centralized electoral systems. (57) Abstract :  
“A. I Enabled Smart Wearable Device For Real Time Carbon Emissions Detection of Data Center ” The rapid expansion of data centers to support the growing digital economy has led to a significant increase in energy consumption and associated carbon emissions, raising urgent sustainability and regulatory compliance challenges. Traditional stationary environmental monitoring systems often lack the mobility, real-time responsiveness, and granularity required to effectively detect and manage emissions within complex data center environments. Addressing these limitations, the present invention introduces an AI-enabled smart wearable device designed for real-time detection, analysis, and management of carbon emissions specifically within data centers. This wearable device integrates advanced miniaturized sensors capable of continuously monitoring critical environmental parameters such as carbon dioxide (CO<sub>2</sub>) concentration, temperature, humidity, and airflow. By combining these sensors with an embedded AI processing unit, the device is capable of performing on-device data preprocessing, anomaly detection, and predictive analytics. This edge-computing capability significantly reduces latency, lowers dependency on cloud infrastructure, and enhances data security. The device’s compact and ergonomic design allows data center personnel to perform dynamic, location-aware environmental monitoring across multiple facility zones, thus providing a higher spatial resolution of emission sources compared to fixed sensor systems. Wireless communication modules embedded within the device enable secure and efficient transmission of collected data to centralized monitoring platforms or cloud-based sustainability dashboards. Integration with existing building management systems (BMS) and energy management tools further supports comprehensive carbon accounting, operational optimization, and regulatory compliance efforts. A biometric-based authentication system ensures that only authorized personnel can activate and access the device, safeguarding sensitive environmental data and maintaining data integrity. The invention’s modular architecture allows for scalable deployment tailored to diverse data center sizes and operational requirements. Real-time analytics generated by the device empower data center operators to proactively identify emission hotspots, equipment malfunctions, or ventilation inefficiencies, enabling timely corrective measures to reduce the carbon footprint and improve energy efficiency. This real-time visibility and control directly support corporate environmental, social, and governance (ESG) goals, as well as adherence to international sustainability standards such as ISO 14001. Furthermore; the device’s adaptability positions it as a key enabling technology for future smart infrastructure ecosystems. As data centers evolve to incorporate next-generation connectivity technologies like 5G and edge computing, this wearable solution can seamlessly integrate with broader IoT frameworks and advanced machine learning models to enhance predictive maintenance and autonomous environmental management. This AI-enabled smart wearable device offers a novel, efficient, and user-centric approach to carbon emission monitoring within data centers. It addresses critical gaps in current monitoring technologies by combining mobility, real-time AI analytics, and secure communication. The invention supports sustainable data center operations, promotes energy efficiency, and facilitates compliance with evolving environmental regulations, thereby contributing to the global transition toward greener digital infrastructure. (57) Abstract :  
“GreenDataCore: INTELLIGENT DATA CENTER POWER EFFICIENCY ANALYSIS AND OPTIMIZATION SYSTEM” The GreenDataCore: Intelligent Data Center Power Efficiency Analysis and Optimization System is a comprehensive web-based calculator that revolutionizes data center infrastructure assessment through automated calculation of power consumption metrics, efficiency analysis, and infrastructure sizing requirements. The system employs integrated modules for DC power consumption analysis, proposed power sizing, heat load calculation, generator capacity sizing, and Power Usage Effectiveness (PUE) assessment, utilizing industry-standard formulas and regulatory compliance parameters. Built on Bootstrap 5.0 frontend with PHP 7.4 backend and MySQL database integration, the platform provides real-time calculation capabilities enabling immediate visualization of infrastructure changes and their impacts on operational costs. The system eliminates the need for expensive DCIM software while delivering professional-grade assessments including automated safety margin application (25% regulatory compliance), UPS inefficiency calculations (32% factor), and cooling capacity sizing with appropriate multipliers for different system types. Users can instantly assess existing DC power utilization, proposed incoming power sizing, heat load requirements, and generator capacity needs through intuitive web interfaces, making data center optimization accessible to facilities without specialized technical expertise or significant software investments. (57) Abstract :  
“Energocytis:Intelligent waste-to-energy conversion system with IoT-enabled stochastic routing optimization ” Energocytis is an intelligent waste-to-energy conversion system that integrates IoT-enabled smart bins with advanced sensor arrays, stochastic dynamic vehicle routing optimization, and anaerobic digestion technology to revolutionize urban waste management while generating renewable energy. The system employs ESP32 microcontrollers with ultrasonic, weight, humidity, infrared, and gas sensors to monitor waste levels, classify waste types, and optimize collection routes using Stochastic Dynamic Vehicle Routing Problem (SDVRP) algorithms that adapt to real-time traffic, weather, and demand uncertainties. Biodegradable waste is processed through IoT-monitored anaerobic digesters producing biogas for electricity generation, achieving 90% energy conversion efficiency and enabling carbon-neutral operations. The cloud-based platform provides predictive analytics, real-time monitoring, and mobile application interfaces for on-demand collection requests, resulting in 45% cost reduction, 38% fuel savings, and 85% landfill diversion while generating surplus renewable energy for grid contribution. (57) Abstract :

Secure and Scalable Healthcare Data Management System Using EOS Blockchain with Hard Fork Enhancements ” The healthcare industry focuses on blockchain technology due to its ability to resolve security problems and improve data exchange capabilities and patient-focused medical care. EOS blockchain presents the necessary features to develop a thorough e-healthcare system because of its flexible and scalable structure. This paper introduces a new way to develop an EOS blockchain-based secure e-healthcare system, which uses hard fork improvements for scalability. EOS blockchain offers suitable healthcare applications through our innovative solutions, which address data privacy access control and data interoperability needs. The proposed system is shown feasible and efficient through complete simulation tests and performance assessments. The research shows that EOS blockchain using hard fork enhancements can transform e-healthcare systems for the future. Fig. 1 (to be published with this figure)

(57) Abstract :  
The present disclosure relates to a sustainability assessment system (102) and a method (300) for affordable housing projects to quantify sustainability performance. The system (102) utilises a predefined set of weighted sustainability criteria, with total weights summing to 100 points. Evaluation data is manually entered via an input device (108) and processed by a processor (104) to calculate a comprehensive sustainability score, i.e. further compared against a predefined threshold to generate a certification output, which visually or electronically indicates compliance of affordable housing projects with sustainability standards. The system (102) is adaptable to various climates zones, and housing types without requiring fundamental changes. Key advantages include facilitating expert-validated, data-driven decision-making during design and construction; optimizing material use and energy efficiency; supporting regulatory compliance and access to financial incentives; and promoting sustainable, affordable housing through continuous performance monitoring. The system (102) enables quicker, practical sustainability assessments aligned with global best practices.

(57) Abstract :  
6. ABSTRACT The present invention discloses a method for joining dissimilar aluminum alloys, specifically AA6061-T6 and AA2017-T6, using friction stir welding (FSW) to fabricate tailor welded blanks (TWBs) with enhanced mechanical and metallurgical properties. The process involves optimizing key FSW parameters—tool rotational speed, welding speed, and tool tilt angle—each varied at three distinct levels to determine their effect on joint strength and ductility. The study employs a Taguchi experimental design to systematically analyze the influence of these parameters, with the ultimate tensile strength and tensile elongation of the welded joints predicted and validated through mathematical regression models and experimental testing. Mechanical characterization, including tensile and notched tensile strength, as well as microhardness and microstructural analysis, is performed on the welded blanks in accordance with ASTM standards. Results demonstrate that the optimal combination of FSW parameters significantly improves joint performance, with all fractures occurring on the advancing side due to the lower strength of AA6061-T6 compared to AA2017-T6. The invention provides a robust approach for manufacturing high-strength, lightweight TWBs suitable for automotive, aerospace, and marine applications, where tailored mechanical properties and process reliability are critical.

## (57) Abstract :

The increasing demand for electric vehicles (EVs), especially in rural and semi-urban regions, has underscored the critical need for efficient and accessible battery charging solutions. This project presents the design and implementation of a cost-effective, adjustable current control EV battery charger, specifically tailored for 12V lead-acid batteries used in small electric vehicles such as e-rickshaws and e-carts. The primary objective is to reduce charging time without compromising battery health, thereby enhancing operational uptime and income opportunities for EV operators. The proposed charger utilizes a transformer-based power supply, an LM358 operational amplifier for current regulation, and a high-power 2N3055 transistor for delivering controlled output. A current sensing resistor and voltage reference circuit provide real-time feedback, enabling precise current adjustment across multiple charging modes — eco, normal, and fast — through simple analog control. The charger operates initially in Constant Current (CC) mode and transitions to Constant Voltage (CV) mode as the battery nears full charge, ensuring safe and efficient charging. Experimental validation demonstrates a 30–40% reduction in charging time compared to conventional chargers, with reliable performance under standard grid conditions. The system's modular design, low cost, and potential for solar integration make it an ideal solution for regions lacking robust charging infrastructure. The charger offers a scalable platform for future enhancements, including lithium-ion battery support and smart microcontroller-based control. Fig. 1

(57) Abstract :

[033] The present invention relates to a system and method for adaptive loan risk assessment using mathematical modeling and integrated political-economic indicators. It utilizes real-time and historical data, including financial transactions, income patterns, credit history, and macroeconomic variables, to dynamically evaluate borrower risk. A combination of advanced algorithms—such as time series analysis, Markov models, logistic regression, support vector machines, Bayesian inference, and neural networks—enables the generation of a Personalized Dynamic Risk Score (PDRS) that evolves with new data inputs. The system features an explainable AI layer to ensure transparency and regulatory compliance, and it includes a decision support interface that offers risk trend visualization and lending recommendations. The invention enhances the accuracy, adaptability, and fairness of credit evaluation processes in banking and financial environments. Accompanied Drawing [FIGS. 1-2]

(57) Abstract :

A Lead-Free Cs<sub>3</sub>Bi<sub>2</sub>I<sub>9</sub>-Based Resistive Switching Memory Device Fabricated Using a Sequential Spin-Coating Method The present invention (200) is a lead-free resistive switching memory device utilizing Cs<sub>3</sub>Bi<sub>2</sub>I<sub>9</sub> (107), an inorganic halide perovskite, fabricated via a cost-effective sequential spin-coating technique. The present deposition method employs two distinct precursor solutions to precisely control iodine vacancy distribution, leading to ultra-low operating voltage at 0.28V and enhanced device stability. The fabricated device exhibits bipolar resistive switching behaviour, reliably transitioning between high-resistance and low-resistance states, making it ideal for non-volatile memory applications. It demonstrates excellent endurance, retaining 36.35% of its original memory after 100 cycles, ensuring reliable performance for long-term data storage. Figure 1 and Figure 2

(57) Abstract :

The present invention relates to a spirooxindole derivatives as a potential anticancer agent comprising of the formula (I) and process for preparation thereof. Particularly, the invention relates to a novel, efficient, and environmentally benign method for the synthesis of 3,4-dihydrobenzo[b]acridine-1,6,11(2H,5H,12H)-trione fused spirooxindole derivatives, which exhibit significant anticancer activity. The invention offers a cost-effective, scalable, and green synthetic route to structurally novel hybrid molecules with promising anticancer potential, thereby making it suitable for pharmaceutical development.

(57) Abstract :

The proposed invention, "Integrated Satellite and Edge AI System for Predicting Agricultural Yields at Scale," presents a cutting-edge computational framework that leverages the synergy between satellite remote sensing and edge-based artificial intelligence to forecast agricultural yields with high accuracy, scalability, and timeliness. This system integrates multi-spectral and hyperspectral data from satellites with real-time, ground-level data collected via edge devices such as drones, IoT sensors, and smart agricultural equipment. By employing advanced AI models—including federated learning, deep learning, and spatiotemporal analysis—directly at the edge, the system minimizes latency, enhances data privacy, and ensures robust predictions even in connectivity-constrained rural regions. The integration enables a continuous learning loop where local edge models refine global models using localized environmental, crop, and soil parameters. This hybrid framework not only reduces reliance on central cloud processing but also enables farmers, agronomists, and policymakers to receive accurate yield estimates, crop health diagnostics, and risk alerts in near real-time. Moreover, the solution is scalable across diverse agro-climatic zones, adaptable to various crop types, and capable of supporting precision agriculture, sustainable farming practices, and food supply chain resilience. Through its data-driven insights, the system aims to enhance food security, optimize resource utilization, and mitigate the risks of crop failures due to climate variability.

(57) Abstract :

The present invention relates to an electric three-wheeler vehicle designed for efficient, eco-friendly transportation in urban and semi-urban environments. The vehicle features a three-wheel configuration with a single front steering wheel and two rear wheels, combining the maneuverability of a motorcycle with the stability of a car. It is powered by a 900W Brushless DC (BLDC) motor with a peak output of up to 2.4 kW, driven by a 48V 40Ah battery. The chassis is constructed using a mix of handmade and recycled components to reduce manufacturing cost and environmental impact. Key features include a lightweight frame, chain-sprocket drive system, mono-shock suspension, integrated electrical systems, and modular battery capability. Additional functionalities such as a voltage booster, onboard diagnostics, and optional solar charging or IoT connectivity enhance performance, reliability, and scalability. The invention offers a low-cost, low-maintenance alternative to traditional fuel-powered three-wheelers, supporting sustainable mobility and addressing the transportation needs of emerging markets.

(57) Abstract :

“ Leveraging Swin-Transformer for Robust Image Quality Assessment in Retinal Vessel Segmentation” The present invention demonstrates that precise segmentation of retinal vessels is vital for detecting abnormalities in the vascular network of the retina, which can aid in the early detection and treatment of conditions like diabetic retinopathy and age-related macular degeneration. Nevertheless, the accuracy of the vessel segments maps can greatly affect the precision of disease detection and diagnosis. Therefore, improving the image quality assessment for retinal vessel segmentation is important for utmost importance. The Swin transformer is a latest in deep learning structure possesses with as shown leading performance in image classification and object detection tasks. The key innovation of our method is the incorporation of the Swin transformer into the conventional U-Net architecture, which is extensively utilized for retinal vessel segmentation. This integration enables the model to better capture long-range dependencies in the retinal image and refine the segmentation results. To assess the image quality, we first extract the retinal vessel map using U-Net. Next, we process the segmented vessels through the Swin-transformer, which creates a high-quality vessel map by refining the initial segmentation. The said model obtained 95.65% accuracy, 97.02% precision, 93.19% recall and 94.82% f1-score. Fig. 1 (to be published with this figure)

(57) Abstract :  
The invention relates to a compact and efficient hydrogen gas generator designed for clean energy applications. The system produces hydrogen through water electrolysis using a sealed electrolysis chamber containing stainless steel electrodes submerged in an alkaline electrolyte solution. Powered by a low-voltage DC supply with an integrated voltage booster and safety circuitry—including a miniature circuit breaker and cooling system—the generator ensures stable and safe hydrogen production. Hydrogen gas is collected in an airtight chamber via tubing equipped with non-return valves, enabling safe storage or direct use. The design emphasizes cost-effectiveness, portability, and scalability, making it suitable for educational purposes, renewable energy projects, and decentralized hydrogen fuel generation.

(57) Abstract :

The present invention relates to a smart helmet designed for enhanced rider safety, connectivity, and intelligent transport support. This wearable electronic system is integrated into a motorcycle helmet and features a microcontroller-based setup that allows real-time accident detection, hands-free communication, and live location tracking. The invention is powered by a rechargeable lithium-ion battery and includes essential components such as a Bluetooth module, GSM-SIM module, GPS module, accelerometer, gyroscope, microphone, and speaker, all working in tandem through a central ESP32 unit. The smart helmet uses the MPU6050 sensor to detect sudden impact or tilt and, when a crash is detected, sends an SOS alert with the rider's GPS coordinates via the GSM module to emergency contacts. In parallel, the Bluetooth system allows the user to answer calls and interact with voice assistants without manual interference, improving road safety. Designed for modern urban users, this helmet supports IoT-based expansion for diagnostics, cloud syncing, and fleet management. The internal electronics are housed in a lightweight casing and powered through a compact charging system via USB-C, with options for solar add-ons. Additional features include LED indicators for signaling. This invention addresses critical safety gaps in two-wheeler mobility and offers a comprehensive, cost-effective, and scalable solution for smart mobility gear, especially in emerging markets where road safety and tech adoption are critical.

(57) Abstract :

“ Retinal Fundus Image and Visual Impairment Classification via ResNet-50 Fine-Tuning and Single Shot Detection Method In this paper, we put forward a single-shot deep image prior (DIP)-based approach for retinal image enhancement. Unlike typical deep learning-based approaches, our method does not require any training data. Instead, our DIP-based method can learn the underlying image prior while using a single degraded image. Employing the ResNet-50 architecture and the Single Shot Detector (SSD) methodology, we have developed a robust model, meticulously fine-tuning several parameters to optimize performance. Our approach utilizes a diverse dataset of retinal fundus images categorized into four classes: diabetic retinopathy, glaucoma, cataracts, and normal vision. The model achieved an accuracy of 92%, marking a noteworthy increase as compared to the previous benchmark. This advancement underscores the potential of our deep learning system to facilitate timely and accurate diagnosis of eye disorders, ultimately contributing to better patient outcomes and effective prevention strategies for visual impairment. The Single Shot MultiBox Detector (SSD) is one of the fastest algorithms in the current target detection field. It has achieved good results in target detection but there are problems such as poor extraction of features in shallow layers and loss of features in deep layers. In this paper, we propose an accurate and efficient target detection method, named Single Shot Object Detection with Feature Enhancement and Fusion (FFESSD), which is to enhance and exploit the shallow and deep features in the feature pyramid structure of the SSD algorithm. To achieve it we introduced the Feature Fusion Module and two Feature Enhancement Modules, and integrated them into the conventional structure of the SSD. Fig. 1 (to be published with this figure)

(57) Abstract :  
The invention relates to a high-performance electric motorcycle constructed using a salvaged internal combustion engine (ICE) motorcycle frame and predominantly recycled or repurposed components. The electric motorcycle features a 15kW peak brushless DC (BLDC) motor and a 72V 60Ah lithium-ion battery pack, enabling a top speed of up to 180 km/h and a range of up to 150 km on a single charge. An advanced vector motor controller with regenerative braking ensures efficient energy management and dynamic ride modes. Additional features include a modular drivetrain for easy upgrades, a TFT digital dashboard with real-time performance monitoring, dual disc brakes with optional ABS, and aerodynamic winglets made from recycled fiberglass. The system is further enhanced by smart helmet integration supporting Bluetooth and voice control. Designed to offer both performance and sustainability, the invention provides a cost-effective, eco-conscious alternative to conventional petrol motorcycles while maintaining high-speed capabilities and rider safety.

(57) Abstract :  
“MEDIFINDER: Geospatial Healthcare Access Platform with Integrated Blood Donor Registry” ABSTRACT Medifinder is an innovative healthcare access platform that addresses key limitations of traditional systems—such as fragmented service discovery, inefficient scheduling, poor emergency coordination, and limited accessibility—by leveraging the MERN stack (MongoDB, Express.js, React.js, Node.js) and real-time geolocation services. It features a responsive React.js frontend with Tailwind CSS, a secure Node.js/Express.js backend with JWT-based multi-role authentication, and scalable MongoDB data management. The platform enables real-time, proximity-based healthcare facility discovery with navigation support, intelligent appointment scheduling with conflict prevention, and an emergency-ready blood donor registry with automated blood type matching and availability tracking. Advanced search filters by specialty, location, and services, while HIPAA-compliant data handling, encrypted transmission, and role-based access control ensure privacy and security. With sub-2-second search response times, 99.8% authentication success, and seamless real-time scheduling, medifinder offers a user-friendly, scalable, and cost-effective solution that improves healthcare accessibility, enhances emergency response, and streamlines service delivery for patients, providers, and administrators. To be published with Fig. 1

(57) Abstract :  
“ ECCRC4c HYBRID CRYPTOGRAPHIC SYSTEM ” ABSTRACT The ECCRC4c hybrid cryptographic system represents a breakthrough innovation in healthcare IoT data security, combining Elliptic Curve Cryptography (ECC) with enhanced RC4c symmetric encryption to eliminate secret key exchange vulnerabilities while achieving unprecedented performance improvements. The invention addresses critical security limitations in urban healthcare IoT infrastructure by implementing a novel four-stage encryption process that integrates asymmetric and symmetric cryptographic strengths. The system generates ephemeral ECC key pairs and computes shared secrets using the elliptic curve Diffie-Hellman protocol, eliminating the need for secret key transmission. The computed shared secret directly initializes an enhanced RC4c algorithm featuring 2's complement addition and left-shifting operations for improved security. The mathematical framework  $C = (M \oplus R) \cdot S + P\_k$  combines XOR-based symmetric encryption efficiency with elliptic curve scalar multiplication security. Extensive testing demonstrates remarkable performance achievements: 89.9% reduction in computation time (0.5942 vs 1.8549 seconds), 94.6% improvement in throughput (0.71355 vs 0.215642 kbps), and enhanced security level (132 vs 120 bits) compared to traditional DESRSA implementations. The system supports real-time healthcare applications while reducing energy consumption in battery-powered IoT devices. The invention's modular architecture facilitates integration with existing healthcare infrastructure while providing scalable deployment capabilities for urban smart city environments. Forward secrecy through ephemeral key generation and resistance to known cryptographic attacks ensure long-term security viability. The ECCRC4c system establishes new standards for efficient, secure healthcare data transmission in IoT environments.

(57) Abstract :  
“HateSentry: Intelligent Real-Time Hate Speech Detection System Using XGBoost Machine Learning” ABSTRACT Traditional content moderation systems face limitations such as manual review bottlenecks, inconsistent accuracy, and poor scalability. To overcome these challenges, we present an Automated Hate Speech Detection System leveraging XGBoost—a robust ensemble learning algorithm—for accurate, scalable, and interpretable content classification. The system employs advanced preprocessing (normalization, tokenization, noise removal) and multi-dimensional feature engineering, including bag-of-words, TF-IDF, n-grams, and word embeddings, to capture lexical and contextual nuances. Optimized via grid search and cross-validation, the XGBoost model incorporates regularization to prevent overfitting and feature importance analysis for transparency. Experimental results demonstrate 85% accuracy, 82% precision, 88% recall, and an 85% F1-score, outperforming traditional classifiers and rivaling deep learning models with greater training efficiency. The system supports real-time processing of 10,000+ posts/minute with sub-second response times and a scalable, memory-efficient architecture. Its modular design enables seamless integration with existing platforms and supports future extensions such as multilingual detection and deep learning enhancements. This solution offers a cost-effective, high-performance approach to automated hate speech moderation at scale. To be published with Fig. 1

(57) Abstract :

ABSTRACT SYSTEM AND METHOD FOR PROVIDING REAL-TIME INSIGHTS TO USER The present invention discloses a system and a method for providing real-time insights to a user. The system (102) obtains real-time sensor data. The system (102) preprocesses the obtained real-time sensor data. The system (102) analyses the real-time sensor data through machine learning models and artificial intelligence models. The system (102) recognises obstacles in an environmental space. The system (102) generates contextual responses for the user. The system (102) provides processed feedback data including real-time haptic feedback and audio feedback. The system (102) detects abrupt motion changes indicative of a fall event. The system (102) provides an optimized processing performance on edge devices (124) and servers (132). The system (102) transmits alert notifications to preregistered emergency contacts upon detection of the abrupt motion changes. The system (102) transfers the processed feedback data for providing the real-time in

(57) Abstract :

The present invention relates to a system (100) and method (400) for estimating the State of Charge (SOC) of lithium-ion batteries (LIBs) with high precision. The system (100) employs a Fractional-Order Model (FOM) (103) to capture the dynamic behaviour of the battery using fractional-order derivative theory. The captured parameters are processed by a hybrid Manta Ray Foraging Optimization with Differential Evolution (MRFODE) (102), combining Manta Ray Foraging Optimization (MRFO) for broad exploration of parameter values and Differential Evolution (DE) for refinement and convergence. The fine-tuned parameters are further utilized by a FO-ARICKF algorithm, which dynamically analyzes real-time data and compensates for errors using an adaptive noise covariance matrix. This comprehensive approach ensures accurate SOC estimation by addressing challenges such as measurement noise, sensor drift, and initialization errors, enabling enhanced performance and reliability under diverse operating conditions. The method (400) is particularly suited for real-world battery management applications. (to be published with Figure 1)

(57) Abstract :

Angular movement of mechanical components is one of the key operations among most of the modern day machines utilized in various sectors including automation, transportation, domestic, and industry. For this purpose, the present invention introduces a microwave technology motivated rugged, more sustainable and better performance delivering rotary sensor (100) for precise measurements of angular movements. The proposed sensor utilizes the combination of two components – stator and rotor. The stator is basically substrate integrated waveguide derived entity while rotor is a resonating element. This novel folded SIW derived microwave rotary sensor is able to sense high dynamic range of angles for 140°, providing better linearity and on the top, best sensitivity of around 7.97 MHz/° compared to most of the available literature till date. (57) Abstract :

Gravity-Assisted Self-Balancing Roller Ramp for Safe Manual Load Transport on Stairs The invention relates to a gravity-assisted, self-balancing roller ramp system designed for safe, manual transportation of heavy loads on staircases without the need for electrical power or complex mechanisms. This energy-efficient system incorporates pivot-mounted rollers that automatically orient based on gravity, ensuring consistent load handling during both ascent and descent. The ramp features semi-cylindrical rollers for inclined sections and hemispherical rollers for landing platforms, each with dual-surface friction profiles—smooth circular faces to ease uphill movement and textured flat faces to provide passive braking during downhill movement. The rollers' self-righting mechanism ensures the system maintains optimal performance without requiring motors, sensors, or batteries. This modular design enables easy adaptation to various stair geometries and allows seamless transitions between slope and landing sections. Made from corrosion-resistant aluminum alloys and high-performance polymers, the system is easy to install, low-maintenance, and durable. Ideal for use in residential, healthcare, public, and light-industrial environments, the system enhances accessibility for elderly, mobility-impaired individuals, and facilitates moving tasks in multi-story buildings where elevators are unavailable. The invention provides a low-cost, sustainable, and energy-efficient alternative to powered stairlifts or motorized conveyors, addressing the gap in existing assistive technologies.

(57) Abstract :

IoT ENABLED SMART PATIENT HEALTH MONITORING SYSTEM USING MACHINE LEARNING APPROACH ABSTRACT A smart health monitoring system is disclosed, which utilizes an IoT-enabled architecture integrated with machine learning models for real-time monitoring and prediction of a subject's health status. The system includes a pulse oximeter sensor, a temperature sensor, and an ECG sensor configured to acquire physiological parameters such as pulse rate, SpO<sub>2</sub> levels, body temperature, and ECG signals. A computing unit processes the data and transmits it to a cloud-based IoT platform for storage and visualization. Machine learning models, including XGBoost and CNN, analyze the data to classify the subject's condition as healthy or unhealthy. The system enables early detection of health abnormalities, real-time alerts, and remote access to health data. Graphical interfaces on the IoT platform display time-series trends, supporting proactive health management and remote diagnosis. [To be published with FIG. 1]

(57) Abstract :

Automated System for Cognitive State Assessment Through Handwriting Analysis ABSTRACT A system and method of assessing cognitive or psychological states based on handwriting analysis are disclosed. The system includes a data acquisition module configured to receive handwriting input from scanned images, smart pens, or touchscreen devices. A preprocessing module performs grayscale conversion, adaptive thresholding, segmentation into lines, words, or characters, and outlier removal using interquartile range filtering. A feature extraction module derives handwriting features such as zone distribution, slant, pressure, size, spacing, stroke, and shape. A classification engine integrates a convolutional neural network for spatial analysis, a long short-term memory network for temporal patterns, and a Random Forest classifier to generate personality or cognitive state labels. An explainability module provides attention maps highlighting influential features. An output module displays predicted traits or conditions through a user interface. [To be published with FIG. 1]

(57) Abstract :

An Automated Natural Disaster Alert & Weather Prediction System ABSTRACT An automated natural disaster alert and weather prediction system implemented as a mobile application is disclosed. The system comprises a processor and memory configured to execute instructions for displaying an interactive map interface, receiving user-selected location input, and retrieving real-time weather, geographic, and historical disaster data via secure APIs. A multi-factor risk assessment engine calculates a disaster risk score based on weighted environmental parameters and historical trends. The system displays color-coded risk markers, weather forecasts for 24- and 48-hour periods, and generates actionable alerts and safety recommendations. Additional modules include predictive modeling for various hazard types, offline processing, mobile optimization, and a risk communication engine prioritizing alerts by severity and proximity. The architecture ensures cross-platform compatibility, personalized user interaction, and continuous operation in low-connectivity scenarios. [To be published with FIG. 1]

(57) Abstract :

A nutrient-rich pellet composition and method of preparing the same disclosed. The composition includes powdered extracts of banana pseudostem, pumpkin seeds, and kulekhara (*Hygrophila auriculata*), and is formulated into a pellet via a binder-free dry compression process. The pellet is iron-fortified and configured to improve haemoglobin levels and address nutritional deficiencies. The banana pseudostem provides dietary fiber and amino acids; the pumpkin seeds offer minerals and unsaturated fats; and the kulekhara extract delivers flavonoids and supports glycemic control. The method of preparation includes cleaning, drying (preferably in a tray dryer), grinding, sieving, and analyzing the powders, followed by ratio optimization using Response Surface Methodology, mixing, and pelletization. The raw materials may be sourced from food waste, offering a low-cost, sustainable approach to produce bioactive, health-promoting dietary supplements for women. [To be published with FIG. 2]

(57) Abstract :

A system and method of enabling AI-assisted personal safety for women in high-risk zones are disclosed. The system includes a processor and a memory storing executable instructions that enable multiple safety functions. A user registration module is configured to receive and store user details and emergency contacts. A real-time monitoring module includes a machine learning model that analyzes environmental and location-specific data to detect potential threats. A threat detection module generates alerts when the user enters predefined high-risk zones based on historical and real-time data. An emergency response module, comprising gesture and voice recognition subsystems, receives user-initiated inputs to trigger safety alerts. A communication interface transmits the alerts to emergency contacts and law enforcement. A dashboard analytics module generates visual reports on crime-prone zones and gender-specific incident distributions for use by safety agencies. [To be published with FIG. 2]

(57) Abstract :

NATUREGRAIN VITALSIP ABSTRACT An instant soup powder composition and method of preparation are disclosed. The composition includes a powdered millet component selected from finger millet, barnyard millet, and other nutritionally dense millets, combined with powdered cucumber peel dried under controlled conditions to retain dietary fiber, antioxidants, and bioactive compounds. The composition further includes powdered functional and flavoring ingredients such as dehydrated vegetable powders, coconut milk powder, salt, sugar, and spices like onion, garlic, ginger, and black pepper. The resulting soup mix is gluten-free, rich in polyphenols, and offers enhanced nutritional and antioxidant benefits. The method involves sequential processing steps including peeling, drying, grinding, mixing, and blending of selected ingredients using batch mixers, enabling the production of a shelf-stable, health-oriented, and easy-to-prepare fortified soup mix suitable for diverse dietary needs. (57) Abstract :

Reconfigurable Smart Antenna Beamformer for Secure Localization Applications ABSTRACT A beamforming system for a smart antenna is disclosed, which enables secure and precise beam pattern generation for wireless sensor networks. The system comprises a reference template module configured to define beam characteristics such as beamwidth, sidelobe level, and nulls in interference directions based on angle of arrival (AoA) data. A CORDIC module computes the array steering vector using binary arithmetic for efficient trigonometric operations. A PSO (Particle Swarm Optimization) module optimizes excitation weights of antenna elements by minimizing the deviation between the desired and actual beam patterns. These modules are interconnected via a multiplier and a subtractor; the multiplier synthesizes the actual pattern, while the subtractor computes the error to guide iterative optimization. The system facilitates reconfigurable, real-time beamforming with high interference rejection and directional precision. [To be published with FIG. 1]

(57) Abstract :

INTELLIGENT IOT-ASSISTED PHASE SELECTOR FOR THREE-PHASE ELECTRICAL NETWORKS ABSTRACT An IoT-enabled automatic phase selection system for a three-phase power input is disclosed. The system comprises a set of input switches for receiving three-phase supply lines, a corresponding set of transformers configured to step down voltage for each phase, and a phase detection circuit comprising diodes and relays to sense phase availability. A control unit, implemented using a processor and memory, receives analog voltage signals from the detection circuit and executes a predefined phase priority logic. Based on this logic, the control unit activates one of multiple output relays to route the available phase to a single-phase load. The system ensures uninterrupted power supply by automatically switching to an active phase when the current phase fails. Integration with IoT enables real-time status updates for remote monitoring and enhances reliability in power-sensitive environments. [To be published with FIG. 1]

(57) Abstract :

GRAPHENE QUANTUM DOT BASED SURFACE PASSIVATION FOR ZnO/CuO NANOWIRE / THIN FILM SOLAR CELLS ON p-SILICON SUBSTRATE

ABSTRACT A thin-film solar cell is disclosed, comprising a p-type silicon (p-Si) substrate, a cupric oxide (CuO) thin film deposited on the substrate to function as a hole transport layer and visible light absorber, and a plurality of vertically aligned zinc oxide (ZnO) nanowires grown on the CuO layer. A graphene quantum dot (GQD) layer is applied over the ZnO nanowires to passivate surface defects and enhance photon conversion. The GQD layer facilitates upconversion of ultraviolet light to visible wavelengths, thereby improving the overall spectral response and efficiency of the solar cell. The combined nanostructured architecture and surface modification enhance charge separation and light harvesting capabilities, making the device suitable for high-efficiency photovoltaic applications. (57) Abstract :

An IoT-based Architecture for Prediction and Analysis of Vehicle Emission Pollutants Using Data-Driven AI ABSTRACT An intelligent emission monitoring system for a vehicle is disclosed. The system includes a gas inlet configured to receive exhaust emissions, a cooling subsystem including both passive and active components to lower gas temperature, and a sensor array positioned downstream to detect carbon monoxide, nitrogen oxides, particulate matter, sulfur dioxide, and volatile organic compounds. An edge computing unit is communicatively coupled to the sensor array and configured to preprocess emission data, execute an artificial intelligence model to classify pollutant levels, predict future emission trends, and generate a corresponding notification. The notification may indicate either a warning or a compliance message. The system enables real-time, AI-driven emission monitoring and prediction, while protecting sensors through thermal management and reducing latency via local edge processing. (57) Abstract :

Advanced AI-Elephant Monitoring System Through Swim Transformers ABSTRACT A system for automated elephant monitoring is disclosed. The system comprises a processor and a memory storing executable instructions to perform a multi-stage AI-based analysis pipeline. The system receives image data from multiple sources via an image acquisition module and enhances image quality using data augmentation through a preprocessing module. Real-time elephant detection is performed using an anchor-free YOLOv8-based detection module. Detected regions are processed using a Swin Transformer feature extraction module to obtain multi-scale hierarchical features. These features are clustered using a Deep Embedded Clustering module without requiring manual labeling. An explainability module employing Integrated Gradients generates visual heatmaps highlighting key features used in classification. The system enables accurate, unsupervised, and interpretable elephant detection for real-time wildlife monitoring and conservation applications. [To be published with FIG. 1]

(57) Abstract :

A Comparative Study of Deep Learning Models for VOC Classification from Resistive Gas Sensors ABSTRACT A system and a method of classifying volatile organic compounds (VOCs) using time-series data from resistive gas sensors are disclosed. The method includes acquiring resistance-based sensor data during exposure and recovery phases, and inputting the data into a processing module comprising a Bi-directional Long Short-Term Memory (BiLSTM) neural network. The BiLSTM model is trained using labeled datasets collected under controlled conditions and configured to capture both forward and backward temporal dependencies in the data. The processing module classifies the sensor data into VOC categories, such as formaldehyde or acetone, and generates a classification output. Comparative analysis with alternative models including LSTM, GRU, BiGRU, 1D CNN, and TCN demonstrates the BiLSTM model's superior accuracy, precision, and recall. The method enables robust, real-time, and explainable VOC detection for environmental and safety applications. [To be published with FIG. 1]

(57) Abstract :

Attention-Guided Deep Learning System for Infant Vocalization Classification Using SMOTE-Optimized Audio Features ABSTRACT A system and method for infant vocalization recognition is disclosed. The system includes a microphone configured to capture audio data and a processor coupled to a memory storing executable instructions. The processor extracts Mel Frequency Cepstral Coefficients (MFCCs) along with delta and delta-delta coefficients using an audio preprocessing module. To address class imbalance, a class balancing module applies Synthetic Minority Over-sampling Technique (SMOTE) to augment rare sound categories. A prediction module classifies the processed features into predefined infant vocalization categories such as hunger, discomfort, laughter, belly pain, and burping. The prediction module implements a deep learning model comprising a spatial convolutional layer, a depthwise separable convolutional layer for efficient spectral learning, a bidirectional GRU network for temporal modeling, and an attention layer for emphasizing discriminative frequency bands. (57) Abstract :

AI-Driven Surveillance for Combatting Poaching and Illegal Hunting Rainforest Birds ABSTRACT A system and a method of AI-driven surveillance enables automated detection of poaching activities and monitoring of bird vocalizations in rainforest environments are disclosed. The system includes a plurality of low-power acoustic sensors configured to capture ambient audio signals and a cloud-based processing unit communicatively linked to the sensors. The processing unit includes a memory and processor that execute instructions to filter background noise, extract spectrogram and frequency features, and classify the audio using a machine learning classifier selected from CNN, RNN, SVM, random forest, or gradient boosting models. Upon identifying gunshots or distress bird calls, the system generates and transmits real-time alerts to conservation authorities. The classifier is continuously updated using new data and feedback, improving accuracy and adaptability over time. The system offers scalable, real-time, and non-intrusive wildlife conservation monitoring. [To be published with FIG. 1]

(57) Abstract :

Personalized Treatment Recommendations and Machine Learning Models for Early Prediction of PCOS ABSTRACT A system and a method for early prediction of Polycystic Ovary Syndrome (PCOS) using machine learning are disclosed. The system comprises a processor and a memory storing instructions which, when executed, cause the processor to receive clinical and physical data of a subject, including parameters such as age, BMI, menstrual cycle regularity, follicle count, hormonal levels, insulin resistance, and dermatological indicators. The data is preprocessed by handling missing values, encoding categorical variables, and scaling numerical features. Feature selection is performed using a Recursive Feature Elimination (RFE) technique to identify the most influential predictors. The processed data is then classified into PCOS-positive or PCOS-negative categories using one or more machine learning models selected from logistic regression, SVM, random forest, CatBoost, and XGBoost. A personalized treatment recommendation is generated based on the classification result. [To be published with FIG. 1]

(57) Abstract :

Transforming Healthcare: Collaborative Unification of GCDSSAML (Genomics, Clinical Decision Support Systems and Advanced Machine Learning) for Precision Medicine ABSTRACT In an embodiment, a healthcare prediction system for personalized treatment recommendation is disclosed. The system includes a processor and memory configured to execute instructions for acquiring genomic and clinical data from a patient cohort, preprocessing the data by imputing missing values, encoding categorical variables, and scaling features. A feature engineering module selects and reduces feature dimensions using statistical and machine learning techniques. A prediction module, employing a supervised machine learning model such as logistic regression, support vector machine, or deep neural network, predicts a binary treatment response. A clinical decision support module then generates tailored therapy recommendations. The system supports real-time operation, ensures interoperability with healthcare systems, and preserves data privacy using federated learning and homomorphic encryption, enabling secure, accurate, and scalable precision medicine deployment. (57) Abstract :

Revolutionizing Smart Agriculture Management System Using AI-Powered Drones ABSTRACT In an embodiment, a smart agriculture management system is disclosed, that includes a drone equipped with a camera to capture aerial images of crop fields and a plurality of IoT-based soil sensors embedded in the soil to collect real-time data, including nitrogen, phosphorus, potassium levels, pH, moisture, temperature, and rainfall. The system includes a computing device communicatively coupled to both the drone and the soil sensors. The computing device executes a machine learning model, including a convolutional neural network, to analyze the aerial images and detect crop disease types and severity levels. Based on the detected disease and real-time soil data, the system generates a treatment plan recommending appropriate pesticides, fertilizers, or irrigation adjustments. The system enables early disease detection, precision treatment, and optimized resource usage, supporting sustainable and autonomous farm management. [To be published with FIG. 1]

(57) Abstract :  
System and Method or Air Quality Index Prediction Using IoT Sensor Networks and Deep Learning for Smart Environment Monitoring  
ABSTRACT In an embodiment, a system for real-time prediction of Air Quality Index (AQI) is disclosed, comprising a network of IoT sensor nodes deployed across multiple geographic locations. Each node includes pollutant and meteorological sensors for measuring PM2.5, PM10, NO<sub>2</sub>, SO<sub>2</sub>, CO, temperature, and humidity, and an edge computing module configured for data preprocessing and local AQI estimation. The system includes a cloud-based server that receives sensor data via a gateway and implements a hybrid deep learning engine integrating convolutional neural networks (CNNs) and long short-term memory (LSTM) networks for spatial-temporal AQI prediction. A context-aware data fusion engine enhances accuracy by incorporating traffic, weather, and temporal metadata. A visualization and notification module provides real-time AQI trends, personalized health advisories, and alerts, supporting dynamic, location-specific environmental monitoring. (57) Abstract :  
Solar Powered IoT based energy efficient Vaccine Preservation Box for Monitoring THS (Temperature-Humidity-Shock Absorbance) parameter without using Tamper prone and costly Active RFID Sticker inside a VPT (Vaccine preservation Vehicle) ABSTRACT In an embodiment, a solar-powered vaccine preservation system is disclosed for real-time monitoring and adaptive cooling during transportation. The system comprises multiple metallic vaccine containers, each equipped with a NodeMCU-based IoT module configured as an MQTT client, along with sensors for measuring temperature, humidity, and vibration. Each container includes a rechargeable battery and power management circuit. A roof-mounted solar panel is subdivided into zones, each zone comprising four thermoelectric Peltier modules positioned at corners, a NodeMCU-Arduino controller acting as an MQTT subscriber, and a motor driver circuit to control cooling intensity. An MQTT cloud server receives environmental data, compares it with predefined thresholds, and issues cooling commands to the zone-specific controllers. The system eliminates reliance on RFID, offers energy efficiency via partial solar operation, and supports remote monitoring and zone-wise cooling control for cold-chain vaccine logistics. (57) Abstract :  
AI-Enhanced Uricase-Based Biosensor for Rapid and Accurate Detection of Hyperuricemia and Gout  
ABSTRACT In an embodiment, a uricase-based biosensing system is disclosed for rapid and early detection of uric acid levels associated with hyperuricemia and gout. The system includes a sensing platform comprising a silicon substrate layered with silicon dioxide, reduced graphene oxide, and zinc oxide, with patterned electrodes forming gate, source, and drain terminals. The gate terminal is functionalized with recombinant uricase enzymes such as Rasburicase or Pegloticase. A microcontroller processes sensor signals using a dielectric measurement circuit that compares the dielectric constant of the enzyme-functionalized gate with that of air, and an electrochemical module that detects changes in drain current and threshold voltage due to uric acid interaction. A machine learning module classifies uric acid levels based on extracted biosensor features, enabling real-time, AI-assisted diagnostics for point-of-care applications. [To be published with FIG. 1]

(57) Abstract :

Mediconnect: an AI-based Integrated Healthcare Platform to improve real-time patient monitoring and diagnostics ABSTRACT In an embodiment, an AI-based health monitoring system (100) for real-time disease detection and personalized medical recommendations is disclosed. The system (100) includes a processor (102) and a memory (104) storing instructions executable to enable patient interaction via a user interface (106), receive medical image data through a data acquisition module (108), and normalize the data using a preprocessing module (110) applying techniques such as Gaussian noise filtering, cropping, resizing, and augmentation. A plurality of machine learning models (112) processes the normalized data to classify one or more diseases selected from Alzheimer's disease, brain tumor, breast cancer, diabetes, COVID-19, pneumonia, and heart disease. A recommendation module (114) generates tailored treatment suggestions based on classification results and historical patient records. The system supports secure, scalable diagnostics and may integrate with blockchain and cloud-based storage. [To be published with FIG. 1]

(57) Abstract :

IoT Based Smart Metallic Manhole Cover (SMMC) for Water Clogging Detection (WCD) using Capacitive sensor (CS) and Prevention using Infrared Heater for Evaporation (IHE) Technique in a Smart City  
ABSTRACT In an embodiment, a smart manhole monitoring system is disclosed for detecting and mitigating water clogging over a manhole cover. The system includes a capacitive sensor configured to sense water accumulation based on dielectric variations between air and water. A microcontroller receives sensor data, determines the presence of clogging by comparing capacitance values against a predefined threshold, and activates an infrared heater to evaporate the detected water. The heater is controlled via a MOSFET-based switching module using pulse-width modulation (PWM) signals generated by the microcontroller. A wireless communication module transmits real-time data regarding clogging events and heater status to a cloud-based MQTT server. The server issues alerts to municipal authorities, enabling timely maintenance. The system operates autonomously and is suitable for integration into smart city infrastructure to enhance public safety and infrastructure longevity. [To be published with FIG. 1]

(57) Abstract :

PEAPODPRO ABSTRACT In an embodiment, a method of producing a fortified functional food ingredient from peapods for incorporation into instant paratha blends is disclosed. The method includes pre-treating peapods by washing, blanching at 90°C–95°C for 2–3 minutes, and rapid cooling to arrest enzymatic activity. The pre-treated peapods are then chemically treated using a solution of 0.1% w/v citric acid and 0.6% w/v sodium bicarbonate to reduce anti-nutritional compounds such as phytic acid and tannins. High pressure processing at 15 psig in a 1:2 w/v aqueous medium is applied to enhance digestibility. The treated peapods are freeze dried to achieve <5% moisture, milled, and sieved to <200 microns particle size. The resulting powder is blended at 7% w/w with a gluten-free millet base (25% sorghum, 25% pearl millet, 50% finger millet) to prepare a nutritionally enhanced paratha mix. [To be published with FIG. 1]

(57) Abstract :

An implementation of CON-CRETE (Smart Contract Creation) using blockchain technology in construction ABSTRACT In an embodiment, a blockchain-based property registration and ownership transfer system (100) is disclosed, that may include a processor (101A) and a memory (101B) storing instructions to execute various modules. A user authentication module (102) may verify identities using biometric and document-based validation. A blockchain ledger (104) may store immutable transaction records. A smart contract module (106) may manage property registration, listing, sale, escrow, and ownership transfer. A property registration module (108) may validate documents with government authorities. A decentralized marketplace interface (110) may enable property listings. An escrow and payment module (112) may secure funds and rights, and an ownership transfer module (114) may issue a digital property certificate, such as an NFT. A decentralized storage system (116) and a two-step verification module (118) may ensure data integrity and access control. [To be published with FIG. 1]

(57) Abstract :

Solar powered IoT based Energy efficient Potato Cold Storage enabling NHCCC (NH3-H2S-CH4-C2H5OH-CO2) for early detection of potato spoilage along with AI based Early- Sprouting Identification and Prevention Technique ABSTRACT In an embodiment, a smart cold storage system for preserving potatoes and preventing spoilage is disclosed. The system includes a storage enclosure equipped with a Peltier-based cooling unit having polarity-reversal functionality for dynamic temperature and humidity control. A camera module periodically captures images of stored potatoes for early sprouting detection using a machine learning model. A zeolite discharging mechanism disperses zeolite powder in response to detected sprouting or high humidity. A set of gas sensors monitors concentrations of spoilage-related volatile organic compounds including ammonia, hydrogen sulfide, methane, ethanol, and carbon dioxide. An exhaust fan is activated to vent contaminated air when carbon dioxide exceeds a predefined threshold. A controller manages the components, processes sensor and image data, and initiates preventive actions to ensure quality retention and extended shelf life of stored potatoes. (57) Abstract :  
Solar Powered IoT Based Automatic THALCH (Temperature-Humidity-Air ventilation-Light, CO<sub>2</sub>- Fungi and Bacteria removing chemical reagent H<sub>2</sub>O<sub>2</sub> misting) control for household Potato Preservation System ABSTRACT In an embodiment, a smart IoT-enabled potato preservation system for medium-scale household storage is disclosed. The system comprises a preservation basket integrated with a temperature and humidity monitoring module, a Peltier Enabled Air Cooling System (PEACS), an Automatic Air Heating System (AAHS), and an Automatic Air Humidifying Mist Generator (AAHMG) to maintain an optimal temperature range of 2°C to 40°C and relative humidity within 85–90%. An automatic ventilation system with damper control, exhaust fan, air quality sensor, and dust sensor regulates airflow based on detected volatile organic compounds and particulates. A CO<sub>2</sub> monitoring module maintains CO<sub>2</sub> concentration within a suitable range. A controller, operatively connected to all modules, processes sensor inputs and activates respective subsystems to stabilize storage conditions. The system may be accessed remotely via an IoT interface for monitoring and control. [To be published with FIG. 1]

(57) Abstract :

Transforming Waste into Energy for Sustainable and Future-Oriented Solutions ABSTRACT A hybrid waste-to-energy system is disclosed for converting plastic-based municipal solid waste into electrical energy. The system comprises a machine learning-based waste segregation unit, a combustion chamber for incinerating plastic waste, and a hybrid energy harvesting assembly including thermoelectric and photovoltaic modules. The harvested energy is regulated through a charging circuit and stored in rechargeable batteries. An inverter circuit converts the stored 12V DC into 230V AC for domestic use. The system further includes an electrostatic precipitator and optional carbon filtration for emission control. Experimental validation demonstrates a near-linear relationship between waste mass and energy output, closely matching theoretical predictions. The compact design enables real-time monitoring and efficient small-scale energy recovery, making it suitable for sustainable waste management and decentralized power generation. (57) Abstract :  
CyberShield: A Real-Time Hardware Trojan Detection Device for Integrated Circuits ABSTRACT A system for real-time detection of hardware anomalies in integrated circuits (ICs) is disclosed. The system includes a monitoring cap mountable on an IC, comprising a data acquisition module for capturing I/O signal data, a side-channel acquisition module for detecting power, timing, and electromagnetic emissions, and a current-voltage sensing unit incorporating an INA219 sensor. A processing module is communicatively coupled to the monitoring cap and includes a processor and memory storing executable instructions. The processor performs feature extraction on collected data, applies anomaly detection algorithms to identify behavioral deviations, and classifies anomalies as Trojan-induced using a trained machine learning model. Upon classification, the system may trigger alerts and initiate mitigation. The architecture enables non-intrusive, real-time security monitoring of ICs, improving detection of hardware Trojans without reliance on golden models or external reference circuits. [To be published with FIG. 1]

## (57) Abstract :

The present investigation aimed to prepare and characterize a biodegradable polymeric nanoparticulate system containing Valsartan to enhance its bioavailability and therapeutic efficacy. Valsartan loaded nanoparticles were formulated by nanoprecipitation method using a biodegradable polymer PLA and Tween 80 or Poloxamer 188 as the stabilizer. Formulated nanoparticles were characterized by particle size determination, poly dispersity index, drug entrapment efficiency, in-vitro drug release, drug-polymer compatibility by FTIR studies, nanoparticulate morphology by ESEM and TEM. Zeta potential study was also performed to understand the surface charge of nanoparticles. The in -vitro drug release tests exhibited a sustained release profile over an extended period, demonstrating the potential of the nanoparticulate system for controlled valsartan delivery. The findings indicate that polymeric nanoparticles represent a promising delivery platform for overcoming the limitations associated with conventional valsartan formulations and improving hypertension treatment outcomes.

(57) Abstract :

The present invention relates to a biodegradable and antibacterial bio-composite film (7) composed of Polyhydroxybutyrate-valerate (PHBV) (4) and neem seed oil (5). The biomaterial composition includes a structural biopolymer substrate (PHBV) (4) providing hydrophobic properties, neem oil (5) as an antibacterial agent, and a solvent medium ensuring uniform dissolution. A reinforcing threadlet sheet (6), facilitates the formation of the biocompatible sheet upon solvent evaporation. The process (200) involves producing PHBV (4) using sugarcane molasses as a carbon source, followed by centrifugation, washing, and dissolution. Neem oil (5) is extracted from neem seeds (2) through grinding, filtration, and solvent evaporation. The neem oil- PHBV solution is applied onto a reinforcing matrix made up of threadlet sheet (6) to form a bio-composite film (7). The present invention offers a sustainable, biodegradable, and non-toxic alternative to conventional biomaterials, with potential applications in wound dressings, tissue engineering, and antibacterial coatings.

(57) Abstract :

The present invention generally relates to a system for detecting Alzheimer's disease to enable secure, agile, and scalable data management and analysis. The system comprises a data acquisition module that collects patient data from various sources, including medical records, genetic profiles, and brain mapping tests. The SDN layer ensures secure transmission and efficient routing of this data across the network. A data preprocessing module cleanses and formats the collected data into a machine-readable form. This is followed by a smart platform development module that processes and analyzes the preprocessed data. A pattern recognition module employing machine learning techniques identifies critical indicators of Alzheimer's risk, such as genetic markers and neuroimaging data. A real-time observation and tracking module monitors live data streams to detect disease progression and issues alerts to healthcare professionals. A secure communication module ensures end-to-end data privacy during storage and transmission.

(57) Abstract :

Flexible High-Sensitivity Capacitive Pressure Sensor Using PVDF–Silver–Kapton Architecture for Wearable Pulse Monitoring A flexible capacitive pressure sensor has been developed using a PVDF (polyvinylidene fluoride) dielectric layer sandwiched between silver electrodes deposited over Kapton substrates. A Nichrome interlayer is introduced to enhance electrode adhesion, and the PVDF layer is spin-coated from a DMF-based solution, resulting in a fibrous, porous morphology that increases deformability and capacitance sensitivity. The sensor exhibits a high sensitivity of 40.05 MPa<sup>-1</sup> across a 0–18 KPa pressure range, with excellent mechanical stability under bending up to 6° curvature and environmental resilience, functioning effectively below 0°C, above 100°C, and in aqueous conditions. Optical characterization reveals high reflectance and negligible absorption in the visible range, enabling stable performance under ambient lighting. Integrated into a wearable wrist-mounted device, the sensor demonstrated accurate beat-to-beat pulse detection, showing potential for continuous health monitoring. Figure 2

## (57) Abstract :

A synthetic mRNA-based vaccine construct for inducing an immune response against Human Metapneumovirus (HMPV), comprising a coding sequence (CDS) of 1318 nucleotides encoding a truncated HMPV fusion (F) protein, a 5' untranslated region (UTR), a 3' untranslated region (UTR), a modified 3' UTR miRNA interaction site engineered to resist miRNA-mediated degradation, and a polyadenylation tail of 101 adenine nucleotides including two internal spacer sequences. A method for producing a thermostable mRNA vaccine against HMPV, comprising the steps of designing a consensus-based coding sequence (CDS) for the HMPV F protein using global sequence data, introducing a D185A mutation in the CDS to enhance protein stability, flanking the CDS with dual-gene 5' and 3' UTRs derived from human genes, modifying the 3' UTR to eliminate miRNA interaction sites, appending a poly(A) tail with integrated spacer sequences, and synthesizing the construct and cloning it into a prokaryotic expression vector for mRNA production.

(57) Abstract :

ABSTRACT Intelligent Fatigue Identification for Industrial Workers using IoMT Devices and Cutting-Edge Advance Machine Learning Methods The present invention discloses a smart, wearable fatigue classification system specifically designed for industrial workers engaged in physically and cognitively demanding tasks. The system comprises a custom-designed PCB integrated with an Arduino Nano RPi Connect microcontroller that interfaces with multiple biosensors, including a dual-channel EEG sensor, a three-lead ECG sensor, a GSR sensor, a body temperature probe, a DHT11 environmental sensor, and a sound level sensor. The EEG electrodes are positioned over the prefrontal cortex (Fp1 and Fp2) using a specially designed head cap, while the ECG electrodes are embedded in a wearable shirt configured in a standard Einthoven triangle (RA, LA, LL). The system captures synchronized physiological and environmental data in real-time, processes and stores the data using an onboard SD card module, and transmits it wirelessly to an Android mobile application via Bluetooth. To establish ground truth labels for fatigue classification, participants are assessed using the validated Multidimensional Fatigue Inventory (MFI-20), which captures five key dimensions of fatigue: general fatigue, physical fatigue, mental fatigue, reduced activity, and reduced motivation. The mobile app visualizes live readings, extracts relevant statistical, spectral, and physiological features, and classifies fatigue states using machine learning algorithms such as SVM, Random Forest, and XGBoost trained on real-world data labeled using the MFI-20 scores. Alerts are generated when critical fatigue thresholds are crossed, enabling preventive interventions. The invention provides a low-cost, scalable, and portable solution for continuous fatigue monitoring in high-risk occupational settings, thereby improving worker safety, productivity, and health outcomes. Refer to Figure 1, Figure 2, Figure 3, Figure 4, Figure 5, Figure 6, Figure 6.

(57) Abstract :

A sliding tile puzzle platform for cognitive development, comprising a body 101 placed on a flat surface with a multiple puzzle blocks 102, with electromagnets 104 enabling attachment and detachment of blocks 102 for interactive puzzle-solving, a display unit 103 to show numbers, alphabets, symbols, or images, a user interface inbuilt in a computing unit to input commands, and an imaging unit 106 mounted via a vertical bar 105 to capture real-time images for emotional analysis, a feedback unit with a vibrating unit and speaker 109 provides tactile and audio responses based on performance, while a holographic projection unit 107 mounted via a ball and socket joint 108 projects 3D hints when needed, a storage compartment 111 with a slit 112 dispenses paper, actuated by a motorized slider 114 connected to a vertical rod 115 with a pop-out ball 116 for smooth dispensing of paper from compartment 111.

(57) Abstract :

A polyherbal face toner formulation and method of preparation thereof is described herein. The formulation comprises 30% of potato extract, 2% of an aloe vera gel, 25% of cucumber extract, 0.1% of peppermint oil, 13% of rose water, and 29.9% of distilled water. Method of preparation of polyherbal face toner formulation is also described. The present invention provides multiple benefits addressing multiple skin concerns such as acne, sunburn, eczema, rashes, dullness unlike many market products that target only single issue. The present invention effectively remove acne, reduce inflammation, provide cooling and soothing effects, minimize pores size, remove dirt and impurities and offer therapeutic benefits.

(57) Abstract :

The present invention provides a handheld system (100) and method (200) for real-time facial recognition and identity verification. The handheld system (100) comprises a camera (1) configured to capture images of one or more faces, a processing unit (2) for detecting faces using a facial detection algorithm, and a memory unit (3) for storing known faces. A user interface module (4), featuring a touchscreen display, enables user login, class selection, and real-time feedback of recognized faces. The method (200) includes capturing images (step 202), detecting faces (step 204), extracting facial landmarks (step 206), generating face encoding vectors (step 208), comparing encodings using cosine similarity (step 210), and displaying recognized identities (step 212). The present invention ensures fast, accurate recognition and is suited for applications such as attendance management, access control, and security monitoring.

(57) Abstract :

ABSTRACT In an embodiment, a junction-less field-effect transistor (JL-FET) based biosensor for multiplexed biomolecule detection is disclosed. The biosensor comprises a silicon-on-insulator (SOI) substrate with a uniformly doped top silicon layer that functions as the source, drain, and channel. A gate dielectric layer is formed over the channel, upon which four spatially separated gate electrodes are arranged using alternating work function metals such as aluminum and nickel. Two detection cavities are embedded within or adjacent to the gate dielectric layer, each functionalized with specific biomolecular receptors. Gold contacts are used as source and drain terminals. Upon analyte binding, local dielectric properties and surface potentials are modulated, resulting in changes in the electric field across the channel. These changes alter the drain current, enabling label-free, real-time, and selective detection of multiple analytes within a compact architecture. [To be published with FIG. 1]

(57) Abstract :

Application No. : ..... ABSTRACT TITLE : “A 6.25m TALL STAMP CHARGE COKE OVEN BATTERY” A 6.25m tall Stamp Charge Coke Oven Battery of 43.67 m3 cake volume provided with 34 nos. of flue and consisting of anchorage system over the flash plate, with Gas Collecting Main, ascension pipe (AP) lid water sealing using water tank arrangement, heating walls provided with twin holes to eliminate hot spot formation, arrangement of sliding joint at oven roof and regenerator level to accommodate differential thermal expansion, arrangement of S.S. sheet at oven roof and at regenerator face wall to prevent leakage, arrangement of both side waste gas tunnel for maintaining heating regime at Pusher and Coke side.

(57) Abstract :

[00106] The present disclosure describes methods, system, transmitter, and receiver for secure transmission and recovery of telemetry data in a telemetry network. The method involves segmenting the telemetry data, each segment is then transformed using a random forward function and processes the telemetry data segmented into data windows using the determined forward function to generate the obfuscated telemetry data, at the transmitter (100). This random selection ensures unpredictability and prevents attackers from identifying patterns in the data. At the receiver (200) side, a trained machine learning model is used to determine the forward function corresponding to the obfuscated telemetry data. Based on the determined forward function a corresponding inverse function is identified. Using the inverse function the telemetry data is recovered from the obfuscated data

(57) Abstract :

An advanced Retrieval Augmented Generation (RAG) system is disclosed, featuring a hybrid search mechanism, adaptive context windowing, and source-based explainability. It integrates large language models with structured information retrieval and user feedback to generate accurate, efficient, and interpretable responses. The system supports continuous ingestion, multi-source reasoning, and on-demand explainable answers, making it suitable for mission-critical applications such as legal research, academic Q&A, and enterprise document automation.
